SCIENTIFIC OPINION

Scientific Opinion on the substantiation of health claims related to phospholipids and protection of DNA, proteins and lipids from oxidative damage (ID 1834), memory, learning capacity and attention, and function of the nervous system (ID 1835) pursuant to Article 13(1) of Regulation (EC) No 1924/2006

EFSA Panel on Dietetic Products, Nutrition and Allergies (NDA)

European Food Safety Authority (EFSA), Parma, Italy

SUMMARY

Following a request from the European Commission, the Panel on Dietetic Products, Nutrition and Allergies was asked to provide a scientific opinion on a list of health claims pursuant to Article 13 of Regulation 1924/2006. This opinion addresses the scientific substantiation of health claims in relation to phospholipids and the following claimed effects: protection of DNA, proteins and lipids from oxidative damage, and memory, learning capacity and attention, and function of the nervous system. The scientific substantiation is based on the information provided by the Member States in the consolidated list of Article 13 health claims and references that EFSA has received from Member States or directly from stakeholders.

The food constituent that is the subject of the health claims is phospholipids. The proposed source of phospholipids is from animal lecithin water emulsion derived from the brain tissue of domestic pig. No information was provided on either the production process or the composition of this phospholipid emulsion. The Panel considers that the food constituent, phospholipids, which is the subject of the health claims, is not sufficiently characterised.

Protection of DNA, proteins and lipids from oxidative damage

The claimed effect “immunity” is not sufficiently defined but in the context of the proposed wording, the Panel assumes that the claimed effect refers to “repairing oxidation damage of cells”. The Panel considers that the protection of DNA, proteins and lipids from oxidative damage is beneficial to human health.

Correspondence: nda@efsa.europa.eu

As the information provided in the list is insufficient to characterise phospholipids that are the subject of the health claim and as none of the references cited were related to the protection of DNA, proteins and lipids from oxidative damage, the Panel concludes that a cause and effect relationship has not been established between the consumption of phospholipids and protection of DNA, proteins and lipids from oxidative damage.

**Memory, learning capacity and attention, and function of the nervous system**

The claimed effect is “mental state and performance”. In the context of the proposed wording, the Panel assumes that the claimed effect refers to memory, learning and concentration (attention), and function of the nervous system. The Panel considers that normal memory, learning capacity and attention, and normal function of the nervous system are beneficial to human health.

As the information provided in the list is insufficient to characterise phospholipids that are the subject of the health claim and as the references provided did not address the claimed effects, the Panel concludes that a cause and effect relationship has not been established between the consumption of phospholipids and normal memory, learning capacity and concentration, and normal function of the nervous system.

**KEY WORDS**

Phospholipids, immunity, immune system, oxidative damage, memory, learning, concentration, nervous system, health claims.

ACKNOWLEDGEMENTS
The European Food Safety Authority wishes to thank for the preparation of this opinion:
The members of the Claims/Sub-Working Group Gut/Immune: Maria Carmen Collado, Miguel Gueimonde, Daisy Jonkers, Martinus Løvik, Bevan Moseley, Maria Saarela, Seppo Salminen, Stephan Strobel and Hendrik van Loveren.
The members of the Claims/Sub-Working Group Mental/Nervous system: Jacques Rigo, Astrid Schloerscheidt, Sean (J.J.) Strain, Barbara Stewart-Knox and Peter Willatts.
INFORMATION AS PROVIDED IN THE CONSOLIDATED LIST

The consolidated list of health claims pursuant to Article 13 of Regulation 1924/2006³ submitted by Member States contains main entry claims with corresponding conditions of use and literature from similar health claims. The information provided in the consolidated list for the health claims that are the subject to this opinion is given in table 1.

Table 1. Main entry health claims related to phospholipids, including conditions of use from similar claims, as proposed in the Consolidated List.

**Conditions of use**
- Food supplement with phospholipid content of 2500mg/100 g = dose. Animal lecithin water emulsion derived from the brain tissue of domestic pig. Active ingredients include linoleic acid (= fatty acid), alpha-linoleic acid (= fatty acid) and choline (= phosphatidylcholine).

ASSESSMENT

1. **Characterisation of the food/constituent**

The food constituent that is the subject of the health claim is phospholipids which are a major component of all cell membranes. Most phospholipids contain a diglyceride, a phosphate group, and a simple organic molecule such as choline.

The proposed source of phospholipids is from animal lecithin water emulsion derived from the brain tissue of domestic pig. Active constituents of the animal lecithin water emulsion derived from the brain tissue of domestic pig emulsion include linoleic acid and alpha-linoleic acid as fatty acids and choline. No further details are given in the references provided on either the production process or the composition of this phospholipid emulsion.

The Panel considers that the food constituent, phospholipids, which is the subject of the health claim, is not sufficiently characterised.

---

2. **Relevance of the claimed effect to human health**

2.1. **Protection of DNA, proteins and lipids from oxidative damage (ID 1834)**

The claimed effect is “immunity”. The Panel assumes that the target population is the general population.

“Immunity” is not sufficiently defined. In the context of the proposed wording, the Panel assumes that the claimed effect refers to “repairing oxidation damage of cells”.

Reactive oxygen species (ROS) including several kinds of radicals are generated in biochemical processes (e.g. respiratory chain) and as a consequence of exposure to exogenous factors (e.g. radiation, pollutants). These reactive intermediates damage biologically relevant molecules such as DNA, proteins and lipids if they are not intercepted by the antioxidant network which includes free radical scavengers like antioxidant nutrients.

The Panel considers that the protection of DNA, proteins and lipids from oxidative damage is beneficial to human health.

2.2. **Memory, learning and concentration, and function of the nervous system (ID 1835)**

The claimed effect is “mental state and performance”. The Panel assumed that the target population is the general population.

In the context of the proposed wording, the Panel assumes that the claimed effect refers to memory, learning and concentration (attention), and function of the nervous system.

The Panel considers that normal memory, learning capacity and attention, and normal function of the nervous system are beneficial to human health.

3. **Scientific substantiation of the claimed effect**

3.1. **Protection of DNA, proteins and lipids from oxidative damage (ID 1834)**

Ten references were cited to substantiate the claimed effect. The Panel notes that none of these references was related to the protection of DNA, proteins and lipids from oxidative damage.

The Panel concludes that a cause and effect relationship has not been established between the consumption of phospholipids and the protection of DNA, proteins and lipids from oxidative damage.

3.2. **Memory, learning capacity and attention, and function of the nervous system (ID 1835)**

The references cited to substantiate the claimed effects included 10 references of which four were on lecithin, one was on choline alfoscerate, one on docosahexaenoic acid, two on omega-3-fatty acids and two on fatty acids in general.

Five references were related to memory, learning and concentration: two reviews on positive effects from fatty acids on brain function; two studies on lecithin treatment of patients with Alzheimer’s disease and patients with impaired cognitive functions, respectively; and, one study on choline alfoscerate and cognitive impairment of patients with mild to moderate dementia of the Alzheimer type. The other five references were related to the nervous system: three were reviews on effects of fatty acids in neurological development, on neuroprotective effects in the retina and on membrane...
structure and function of neuronal tissues; and two were on lecithin as a possible treatment of tardive dyskinesia.

The Panel considers that the evidence provided does not establish that results obtained with the patient populations studied can be extrapolated to the general population, and that the other references provided did not address the relationship between the consumption of phospholipids (animal lecithin water emulsion derived from the brain tissue of domestic pig) and memory, learning, attention and function of the nervous system.

The Panel concludes that a cause and effect relationship has not been established between the consumption of phospholipids and normal memory, learning capacity and attention, and normal function of the nervous system.

CONCLUSIONS
On the basis of the data available, the Panel concludes that:

- The food constituent, phospholipids, which is the subject of the health claim, is not sufficiently characterised.

Protection of DNA, proteins and lipids from oxidative damage (ID 1834)

- The claimed effect is “immunity”. The target population is assumed to be the general population. Protection of DNA, proteins and lipids from oxidative damage is beneficial to human health.

- A cause and effect relationship has not been established between the consumption of phospholipids and protection of DNA, proteins and lipids from oxidative damage.

Memory, learning and concentration, and function of the nervous system (ID 1835)

- The claimed effect is “mental state and performance”. The target population is assumed to be the general population. Normal memory, learning capacity and attention, and normal function of the nervous system are beneficial to human health.

- A cause and effect relationship has not been established between the consumption of phospholipids and normal memory, learning capacity and attention, and normal function of the nervous system.

DOCUMENTATION PROVIDED TO EFSA
Health claims pursuant to Article 13 of Regulation (EC) No 1924/2006 (No: EFSA-Q-2008-2567, EFSA-Q-2008-2568). The scientific substantiation is based on the information provided by the Member States in the consolidated list of Article 13 health claims and references that EFSA has received from Member States or directly from stakeholders.

The full list of supporting references as provided to EFSA is available on: http://www.efsa.europa.eu/panels/nda/claims/article13.htm.
APPENDICES

APPENDIX A

BACKGROUND AND TERMS OF REFERENCE AS PROVIDED BY THE EUROPEAN COMMISSION

The Regulation 1924/2006 on nutrition and health claims made on foods4 (hereinafter "the Regulation") entered into force on 19th January 2007.

Article 13 of the Regulation foresees that the Commission shall adopt a Community list of permitted health claims other than those referring to the reduction of disease risk and to children's development and health. This Community list shall be adopted through the Regulatory Committee procedure and following consultation of the European Food Safety Authority (EFSA).

Health claims are defined as "any claim that states, suggests or implies that a relationship exists between a food category, a food or one of its constituents and health".

In accordance with Article 13 (1) health claims other than those referring to the reduction of disease risk and to children's development and health are health claims describing or referring to:

a) the role of a nutrient or other substance in growth, development and the functions of the body; or
b) psychological and behavioural functions; or
c) without prejudice to Directive 96/8/EC, slimming or weight-control or a reduction in the sense of hunger or an increase in the sense of satiety or to the reduction of the available energy from the diet.

To be included in the Community list of permitted health claims, the claims shall be:

(i) based on generally accepted scientific evidence; and
(ii) well understood by the average consumer.

Member States provided the Commission with lists of claims as referred to in Article 13 (1) by 31 January 2008 accompanied by the conditions applying to them and by references to the relevant scientific justification. These lists have been consolidated into the list which forms the basis for the EFSA consultation in accordance with Article 13 (3).

ISSUES THAT NEED TO BE CONSIDERED

IMPORTANCE AND PERTINENCE OF THE FOOD5

Foods are commonly involved in many different functions6 of the body, and for one single food many health claims may therefore be scientifically true. Therefore, the relative importance of food e.g. nutrients in relation to other nutrients for the expressed beneficial effect should be considered: for functions affected by a large number of dietary factors it should be considered whether a reference to a single food is scientifically pertinent.

It should also be considered if the information on the characteristics of the food contains aspects pertinent to the beneficial effect.

SUBSTANTIATION OF CLAIMS BY GENERALLY ACCEPTABLE SCIENTIFIC EVIDENCE

Scientific substantiation is the main aspect to be taken into account to authorise health claims. Claims should be scientifically substantiated by taking into account the totality of the available scientific data, and by weighing the evidence, and shall demonstrate the extent to which:

4 OJ L12, 18/01/2007
5 The term 'food' when used in this Terms of Reference refers to a food constituent, the food or the food category.
6 The term 'function' when used in this Terms of Reference refers to health claims in Article 13(1)(a), (b) and (c).
Phospholipids related health claims

(a) the claimed effect of the food is beneficial for human health,
(b) a cause and effect relationship is established between consumption of the food and the claimed effect in humans (such as: the strength, consistency, specificity, dose-response, and biological plausibility of the relationship),
(c) the quantity of the food and pattern of consumption required to obtain the claimed effect could reasonably be achieved as part of a balanced diet,
(d) the specific study group(s) in which the evidence was obtained is representative of the target population for which the claim is intended.

EFSA has mentioned in its scientific and technical guidance for the preparation and presentation of the application for authorisation of health claims consistent criteria for the potential sources of scientific data. Such sources may not be available for all health claims. Nevertheless it will be relevant and important that EFSA comments on the availability and quality of such data in order to allow the regulator to judge and make a risk management decision about the acceptability of health claims included in the submitted list.

The scientific evidence about the role of a food on a nutritional or physiological function is not enough to justify the claim. The beneficial effect of the dietary intake has also to be demonstrated. Moreover, the beneficial effect should be significant i.e. satisfactorily demonstrate to beneficially affect identified functions in the body in a way which is relevant to health. Although an appreciation of the beneficial effect in relation to the nutritional status of the European population may be of interest, the presence or absence of the actual need for a nutrient or other substance with nutritional or physiological effect for that population should not, however, condition such considerations.

Different types of effects can be claimed. Claims referring to the maintenance of a function may be distinct from claims referring to the improvement of a function. EFSA may wish to comment whether such different claims comply with the criteria laid down in the Regulation.

**WORDING OF HEALTH CLAIMS**

Scientific substantiation of health claims is the main aspect on which EFSA’s opinion is requested. However, the wording of health claims should also be commented by EFSA in its opinion.

There is potentially a plethora of expressions that may be used to convey the relationship between the food and the function. This may be due to commercial practices, consumer perception and linguistic or cultural differences across the EU. Nevertheless, the wording used to make health claims should be truthful, clear, reliable and useful to the consumer in choosing a healthy diet.

In addition to fulfilling the general principles and conditions of the Regulation laid down in Article 3 and 5, Article 13(1)(a) stipulates that health claims shall describe or refer to "the role of a nutrient or other substance in growth, development and the functions of the body". Therefore, the requirement to describe or refer to the 'role' of a nutrient or substance in growth, development and the functions of the body should be carefully considered.

The specificity of the wording is very important. Health claims such as "Substance X supports the function of the joints" may not sufficiently do so, whereas a claim such as "Substance X helps maintain the flexibility of the joints" would. In the first example of a claim it is unclear which of the various functions of the joints is described or referred to contrary to the latter example which specifies this by using the word "flexibility".

The clarity of the wording is very important. The guiding principle should be that the description or reference to the role of the nutrient or other substance shall be clear and unambiguous and therefore be specified to the extent possible i.e. descriptive words/terms which can have multiple meanings should be avoided. To this end, wordings like "strengthens your natural defences" or "contain antioxidants" should be considered as well as "may" or "might" as opposed to words like "contributes", "aids" or "helps".
In addition, for functions affected by a large number of dietary factors it should be considered whether wordings such as "indispensable", "necessary", "essential" and "important" reflects the strength of the scientific evidence.

Similar alternative wordings as mentioned above are used for claims relating to different relationships between the various foods and health. It is not the intention of the regulator to adopt a detailed and rigid list of claims where all possible wordings for the different claims are approved. Therefore, it is not required that EFSA comments on each individual wording for each claim unless the wording is strictly pertinent to a specific claim. It would be appreciated though that EFSA may consider and comment generally on such elements relating to wording to ensure the compliance with the criteria laid down in the Regulation.

In doing so the explanation provided for in recital 16 of the Regulation on the notion of the average consumer should be recalled. In addition, such assessment should take into account the particular perspective and/or knowledge in the target group of the claim, if such is indicated or implied.

**TERMS OF REFERENCE**

**HEALTH CLAIMS OTHER THAN THOSE REFERRING TO THE REDUCTION OF DISEASE RISK AND TO CHILDREN'S DEVELOPMENT AND HEALTH**

EFSA should in particular consider, and provide advice on the following aspects:

- Whether adequate information is provided on the characteristics of the food pertinent to the beneficial effect.
- Whether the beneficial effect of the food on the function is substantiated by generally accepted scientific evidence by taking into account the totality of the available scientific data, and by weighing the evidence. In this context EFSA is invited to comment on the nature and quality of the totality of the evidence provided according to consistent criteria.
- The specific importance of the food for the claimed effect. For functions affected by a large number of dietary factors whether a reference to a single food is scientifically pertinent.

In addition, EFSA should consider the claimed effect on the function, and provide advice on the extent to which:

- the claimed effect of the food in the identified function is beneficial.
- a cause and effect relationship has been established between consumption of the food and the claimed effect in humans and whether the magnitude of the effect is related to the quantity consumed.
- where appropriate, the effect on the function is significant in relation to the quantity of the food proposed to be consumed and if this quantity could reasonably be consumed as part of a balanced diet.
- the specific study group(s) in which the evidence was obtained is representative of the target population for which the claim is intended.
- the wordings used to express the claimed effect reflect the scientific evidence and complies with the criteria laid down in the Regulation.

When considering these elements EFSA should also provide advice, when appropriate:

- on the appropriate application of Article 10 (2) (c) and (d) in the Regulation, which provides for additional labelling requirements addressed to persons who should avoid using the food; and/or warnings for products that are likely to present a health risk if consumed to excess.
APPENDIX B

EFSA DISCLAIMER

The present opinion does not constitute, and cannot be construed as, an authorisation to the marketing of the food/food constituent, a positive assessment of its safety, nor a decision on whether the food/food constituent is, or is not, classified as foodstuffs. It should be noted that such an assessment is not foreseen in the framework of Regulation (EC) No 1924/2006.

It should also be highlighted that the scope, the proposed wordings of the claims and the conditions of use as proposed in the Consolidated List may be subject to changes, pending the outcome of the authorisation procedure foreseen in Article 13(3) of Regulation (EC) No 1924/2006.
