SCIENTIFIC OPINION

Scientific opinion on the substantiation of health claims related to Equisetum arvense L. and invigoration of the body (ID 2437), maintenance of skin (ID 2438), maintenance of hair (ID 2438), maintenance of bone (ID 2439), and maintenance or achievement of a normal body weight (ID 2783) pursuant to Article 13 of Regulation (EC) No 1924/2006

EFSA Panel on Dietetic Products, Nutrition and Allergies (NDA)

European Food Safety Authority (EFSA), Parma, Italy

SUMMARY

Following a request from the European Commission, the Panel on Dietetic Products, Nutrition and Allergies was asked to provide a scientific opinion on a list of health claims pursuant to Article 13 of Regulation 1924/2006. This opinion addresses the scientific substantiation of health claims in relation to Equisetum arvense L. and invigoration of the body, maintenance of skin, maintenance of hair, maintenance of bone, and maintenance or achievement of a normal body weight. The scientific substantiation is based on the information provided by the Member States in the consolidated list of Article 13 health claims and references that EFSA has received from Member States or directly from stakeholders.

The food constituent that is the subject of the health claims is Equisetum arvense L.

Invigoration of the body

The Panel considers that Equisetum arvense L. has not been sufficiently characterised for invigoration of the body.

The claimed effect “invigoration of the body” is not sufficiently defined. From the proposed wordings the Panel could not identify relevant endpoints related to the health relationship. As the claimed effect has not been sufficiently defined, the Panel concludes that its relevance to human health cannot be evaluated.

The Panel notes that the references cited are not related to the claimed effect and did not provide any scientific data that could be used to substantiate the claimed effect. The Panel concludes that a cause

For citation purposes: EFSA Panel on Dietetic Products, Nutrition and Allergies (NDA); Scientific opinion on the substantiation of health claims related to Equisetum arvense L. and invigoration of the body (ID 2437), maintenance of skin (ID 2438), maintenance of hair (ID 2438), maintenance of bone (ID 2439), and maintenance or achievement of a normal body weight (ID 2783) pursuant to Article 13 of Regulation (EC) No 1924/2006 on request from the European Commission. EFSA Journal 2009; 7(9):1289. [16 pp.], doi:10.2903/j.efsa.2009.1289. Available online: www.efsa.europa.eu
and effect relationship has not been established between the consumption of Equisetum arvense L. and invigoration of the body.

**Maintenance of skin**

The Panel considers that Equisetum arvense L. has not been sufficiently characterised for maintenance of normal skin.

The claimed effect is “skin, hair health”. The Panel considers that maintenance of normal skin is beneficial to human health.

One reference was cited to substantiate the claimed effect. This reference was not accessible to the Panel, even after every reasonable effort was made to retrieve it. The Panel concludes that a cause and effect relationship has not been established between the consumption of Equisetum arvense L. and maintenance of normal skin.

**Maintenance of hair**

The Panel considers that Equisetum arvense L. has not been sufficiently characterised for maintenance of normal hair.

The claimed effect is “skin, hair health”. The Panel considers that maintenance of normal hair is beneficial to human health.

One reference was cited to substantiate the claimed effect. This reference was not accessible to the Panel, even after every reasonable effort was made to retrieve it. The Panel concludes that a cause and effect relationship has not been established between the consumption of Equisetum arvense L. and maintenance of normal hair.

**Maintenance of bone**

The Panel considers that Equisetum arvense L. has not been sufficiently characterised for maintenance of normal bone.

The claimed effect is “bone health”. The Panel considers that maintenance of normal bone is beneficial to human health.

One reference was cited to substantiate the claimed effect. This reference was not accessible to the Panel, even after every reasonable effort was made to retrieve it. The Panel concludes that a cause and effect relationship has not been established between the consumption of Equisetum arvense L. and maintenance of normal bone.

**Maintenance or achievement of normal body weight**

The Panel considers that Equisetum arvense L. has been sufficiently characterised for the maintenance or achievement of a normal body weight with the following conditions of use: dried powder from the sterile aerial part: 400 mg/day.

The claimed effect is “amincissement”. From the proposed wordings the Panel assumes that the claimed effect is related to the maintenance or achievement of a normal body weight. The Panel considers that the maintenance or achievement of a normal body weight is beneficial to human health.

The Panel notes that the reference cited did not provide any scientific data that could be used to substantiate the claimed effect. The Panel concludes that a cause and effect relationship has not been established between the consumption of Equisetum arvense L. and the maintenance or achievement of a normal body weight.

ACKNOWLEDGEMENTS
The European Food Safety Authority wishes to thank for the preparation of this opinion:
The members of the Claims/Sub-Working Group Characterisation of Botanicals: Robert Anton, Luc Delmulle, Kirsten Pilegaard, Mauro Serafini and Hans Verhagen.
**INFORMATION AS PROVIDED IN THE CONSOLIDATED LIST**

The consolidated list of health claims pursuant to Article 13 of Regulation 1924/2006\(^3\) submitted by Member States contains main entry claims with corresponding conditions of use and literature from similar health claims. The information provided in the consolidated list for the health claims subject to this opinion is given in Table 1.

Table 1. Main entry health claims related to *Equisetum arvense* L., including conditions of use from similar claims, as proposed in the Consolidated List.

ASSESSMENT

1. Characterisation of the food/constituent

The food constituent that is the subject of the health claims is *Equisetum arvense* L.. The characterisation of *Equisetum arvense* L. is performed by comparing data provided as conditions of use to information extracted from standard reference textbooks (see Table 2 below and Appendix C for list of standard reference textbooks used for the characterisation).

Table 2. Information on *Equisetum arvense* L. from standard reference textbooks and the information provided as conditions of use.

ID 2437, 2438, 2439:

The nature of the preparation is not given, but it is assumed to be the dried herb. The daily amount is not specified. The Panel notes that the consolidated list contains insufficient information to allow a characterisation of *Equisetum arvense* L.

The Panel notes that there is no information on the other components of the multibotanical combination.

The Panel considers that the food constituent, *Equisetum arvense* L., which is the subject of the health claim, has not been sufficiently characterised.

ID 2783:

The nature of the preparation is not given, but it is assumed to be the powder.
The Panel considers that the food constituent, *Equisetum arvense* L., which is the subject of the health claim, has been sufficiently characterised with the following conditions of use: dried powder from the sterile aerial part: 400 mg/day.

2. **Relevance of the claimed effect to human health**

2.1. **Invigoration of the body (ID 2437)**

The claimed effect is “invigoration of the body”. The Panel assumes that the target population is the general population.

From the proposed wordings the Panel could not identify relevant endpoints related to the health relationship.

The Panel considers that the claimed effect has not been sufficiently defined and therefore concludes that its relevance to human health cannot be evaluated.

2.2. **Maintenance of skin (ID 2438)**

The claimed effect is “skin, hair health”. The Panel assumes that the target population is the general population.

The Panel considers that maintenance of normal skin is beneficial to human health.

2.3. **Maintenance of hair (ID 2438)**

The claimed effect is “skin, hair health”. The Panel assumes that the target population is the general population.

The Panel considers that maintenance of normal hair is beneficial to human health.

2.4. **Maintenance of bone (ID 2439)**

The claimed effect is “bone health”. The Panel assumes that the target population is the general population.

The Panel considers that maintenance of normal bone is beneficial to human health.

2.5. **Maintenance or achievement of a normal body weight (ID 2783)**

The claimed effect is “amincissement”. The Panel assumes that the target population is the general population.

From the proposed wordings, the Panel assumes that the claimed effect is related to the maintenance or achievement of a normal body weight. In this context, even a moderate weight loss in overweight subjects without achieving a normal body weight is considered beneficial to health.

The Panel considers that the maintenance or achievement of a normal body weight is beneficial to human health.
3. Scientific substantiation of the claimed effects

3.1. Invigoration of the body (ID 2437)

Four references were cited to substantiate the claimed effect. One reference was a periodical. One reference was an animal study examining the antinociceptive and anti-inflammatory properties of the hydroalcoholic extract of stems from *Equisetum arvense* L. (Do Monte et al., 2004). Another animal study investigated chronic administration of the hydroalcoholic extract of stems from *Equisetum arvense* L. on cognitive impairment (Dos Santos Junior et al., 2005a). A third animal study examined the sedative and anticonvulsant effects of hydroalcoholic extract of *Equisetum arvense* L. (Dos Santos Junior et al., 2005b). The Panel notes that the references cited are not related to the claimed effect and did not provide any scientific data that could be used to substantiate the claimed effect.

The Panel concludes that a cause and effect relationship has not been established between the consumption of *Equisetum arvense* L. and invigoration of the body.

3.2. Maintenance of skin (ID 2438)

One reference was cited to substantiate the claimed effect. This reference was a periodical which was not accessible to the Panel, even after every reasonable effort was made to retrieve it.

The Panel concludes that a cause and effect relationship has not been established between the consumption of *Equisetum arvense* L. and maintenance of normal skin.

3.3. Maintenance of hair (ID 2438)

One reference was cited to substantiate the claimed effect. This reference was a periodical which was not accessible to the Panel, even after every reasonable effort was made to retrieve it.

The Panel concludes that a cause and effect relationship has not been established between the consumption of *Equisetum arvense* L. and maintenance of normal hair.

3.4. Maintenance of bone (ID 2439)

One reference was cited to substantiate the claimed effect. This reference was a periodical which was not accessible to the Panel, even after every reasonable effort was made to retrieve it.

The Panel concludes that a cause and effect relationship has not been established between the consumption of *Equisetum arvense* L. and maintenance of normal bone.

3.5. Maintenance or achievement of a normal body weight (ID 2783)

One reference was cited to substantiate the claimed effect. This reference is a guidance document. The Panel notes that the reference cited did not provide any scientific data that could be used to substantiate the claimed effect.

The Panel concludes that a cause and effect relationship has not been established between the consumption of *Equisetum arvense* L. and the maintenance or achievement of a normal body weight.
CONCLUSIONS
On the basis of the data presented, the Panel concludes that:

Invigoration of the body (ID 2437)

- The food constituent, *Equisetum arvense* L., which is the subject of the health claim, has not been sufficiently characterised for invigoration of the body.
- The claimed effect is “body invigoration”. The target population is assumed to be the general population. Invigoration of the body is not sufficiently defined.
- A cause and effect relationship has not been established between the consumption of *Equisetum arvense* L. and invigoration of the body.

Maintenance of skin (ID 2438)

- The food constituent, *Equisetum arvense* L., which is the subject of the health claim, has not been sufficiently characterised for maintenance of normal skin.
- The claimed effect is “skin, hair health”. The target population is assumed to be the general population. Maintenance of normal skin is beneficial to human health.
- A cause and effect relationship has not been established between the consumption of *Equisetum arvense* L. and maintenance of normal skin.

Maintenance of hair (ID 2438)

- The food constituent, *Equisetum arvense* L., which is the subject of the health claim, has not been sufficiently characterised for maintenance of normal hair.
- The claimed effect is “skin, hair health”. The target population is assumed to be the general population. Maintenance of normal hair is beneficial to human health.
- A cause and effect relationship has not been established between the consumption of *Equisetum arvense* L. and maintenance of normal hair.

Maintenance of bone (ID 2439)

- The food constituent, *Equisetum arvense* L., which is the subject of the health claim, has not been sufficiently characterised for maintenance of normal bone.
- The claimed effect is “bone health”. The target population is assumed to be the general population. Maintenance of normal bone is beneficial to human health.
- A cause and effect relationship has not been established between the consumption of *Equisetum arvense* L. and maintenance of normal bone.

Maintenance or achievement of a normal body weight (ID 2783)

- The food constituent, *Equisetum arvense* L., which is the subject of the health claim, has been sufficiently characterised for maintenance or achievement of a normal body weight with the following conditions of use: dried powder from the sterile aerial part: 400 mg/day.
- The claimed effect is “a mincissement”. The target population is assumed to be the general population. The maintenance or achievement of a normal body weight is beneficial to human health.
- A cause and effect relationship has not been established between the consumption of *Equisetum arvense* L. and the maintenance or achievement of a normal body weight.
**DOCUMENTATION PROVIDED TO EFSA**

Health claims pursuant to Article 13 of Regulation (EC) No 1924/2006 (No: EFSA-Q-2008-3170, EFSA-Q-2008-3171, EFSA-Q-2008-3172, EFSA-Q-2008-3516). The scientific substantiation is based on the information provided by the Member States in the consolidated list of Article 13 health claims and references that EFSA has received from Member States or directly from stakeholders.

**REFERENCES**

APPENDICES

APPENDIX A

BACKGROUND AND TERMS OF REFERENCE AS PROVIDED BY THE EUROPEAN COMMISSION

The Regulation 1924/2006 on nutrition and health claims made on foods \(^4\) (hereinafter "the Regulation") entered into force on 19\(^{th}\) January 2007.

Article 13 of the Regulation foresees that the Commission shall adopt a Community list of permitted health claims other than those referring to the reduction of disease risk and to children's development and health. This Community list shall be adopted through the Regulatory Committee procedure and following consultation of the European Food Safety Authority (EFSA).

Health claims are defined as "any claim that states, suggests or implies that a relationship exists between a food category, a food or one of its constituents and health".

In accordance with Article 13 (1) health claims other than those referring to the reduction of disease risk and to children's development and health are health claims describing or referring to:

a) the role of a nutrient or other substance in growth, development and the functions of the body; or

b) psychological and behavioural functions; or

c) without prejudice to Directive 96/8/EC, slimming or weight-control or a reduction in the sense of hunger or an increase in the sense of satiety or to the reduction of the available energy from the diet.

To be included in the Community list of permitted health claims, the claims shall be:

(i) based on generally accepted scientific evidence; and

(ii) well understood by the average consumer.

Member States provided the Commission with lists of claims as referred to in Article 13 (1) by 31 January 2008 accompanied by the conditions applying to them and by references to the relevant scientific justification. These lists have been consolidated into the list which forms the basis for the EFSA consultation in accordance with Article 13 (3).

 ISSUES THAT NEED TO BE CONSIDERED

IMPORTANCE AND PERTINENCE OF THE FOOD \(^5\)

Foods are commonly involved in many different functions \(^6\) of the body, and for one single food many health claims may therefore be scientifically true. Therefore, the relative importance of food e.g. nutrients in relation to other nutrients for the expressed beneficial effect should be considered: for functions affected by a large number of dietary factors it should be considered whether a reference to a single food is scientifically pertinent.

It should also be considered if the information on the characteristics of the food contains aspects pertinent to the beneficial effect.

SUBSTANTIATION OF CLAIMS BY GENERALLY ACCEPTABLE SCIENTIFIC EVIDENCE

Scientific substantiation is the main aspect to be taken into account to authorise health claims. Claims should be scientifically substantiated by taking into account the totality of the available scientific data, and by weighing the evidence, and shall demonstrate the extent to which:

\(^4\) OJ L12, 18/01/2007

\(^5\) The term 'food' when used in this Terms of Reference refers to a food constituent, the food or the food category.

\(^6\) The term 'function' when used in this Terms of Reference refers to health claims in Article 13(1)(a), (b) and (c).
(a) the claimed effect of the food is beneficial for human health,
(b) a cause and effect relationship is established between consumption of the food and the
claimed effect in humans (such as: the strength, consistency, specificity, dose-
response, and biological plausibility of the relationship),
(c) the quantity of the food and pattern of consumption required to obtain the claimed
effect could reasonably be achieved as part of a balanced diet,
(d) the specific study group(s) in which the evidence was obtained is representative of the
target population for which the claim is intended.

EFSA has mentioned in its scientific and technical guidance for the preparation and presentation of
the application for authorisation of health claims consistent criteria for the potential sources of
scientific data. Such sources may not be available for all health claims. Nevertheless it will be
relevant and important that EFSA comments on the availability and quality of such data in order to
allow the regulator to judge and make a risk management decision about the acceptability of health
claims included in the submitted list.

The scientific evidence about the role of a food on a nutritional or physiological function is not
enough to justify the claim. The beneficial effect of the dietary intake has also to be demonstrated.
Moreover, the beneficial effect should be significant i.e. satisfactorily demonstrate to beneficially
affect identified functions in the body in a way which is relevant to health. Although an appreciation
of the beneficial effect in relation to the nutritional status of the European population may be of
interest, the presence or absence of the actual need for a nutrient or other substance with nutritional or
physiological effect for that population should not, however, condition such considerations.

Different types of effects can be claimed. Claims referring to the maintenance of a function may be
distinct from claims referring to the improvement of a function. EFSA may wish to comment whether
such different claims comply with the criteria laid down in the Regulation.

**Wording of Health Claims**

Scientific substantiation of health claims is the main aspect on which EFSA's opinion is requested.
However, the wording of health claims should also be commented by EFSA in its opinion.

There is potentially a plethora of expressions that may be used to convey the relationship between
the food and the function. This may be due to commercial practices, consumer perception and linguistic
or cultural differences across the EU. Nevertheless, the wording used to make health claims should be
truthful, clear, reliable and useful to the consumer in choosing a healthy diet.

In addition to fulfilling the general principles and conditions of the Regulation laid down in Article 3
and 5, Article 13(1)(a) stipulates that health claims shall describe or refer to "the role of a nutrient or
other substance in growth, development and the functions of the body". Therefore, the requirement to
describe or refer to the 'role' of a nutrient or substance in growth, development and the functions of
the body should be carefully considered.

The specificity of the wording is very important. Health claims such as "Substance X supports the
function of the joints" may not sufficiently do so, whereas a claim such as "Substance X helps
maintain the flexibility of the joints" would. In the first example of a claim it is unclear which of the
various functions of the joints is described or referred to contrary to the latter example which
specifies this by using the word "flexibility".

The clarity of the wording is very important. The guiding principle should be that the description or
reference to the role of the nutrient or other substance shall be clear and unambiguous and therefore
be specified to the extent possible i.e. descriptive words/ terms which can have multiple meanings
should be avoided. To this end, wordings like "strengthens your natural defences" or "contain
antioxidants" should be considered as well as "may" or "might" as opposed to words like
"contributes", "aids" or "helps".
In addition, for functions affected by a large number of dietary factors it should be considered whether wordings such as "indispensable", "necessary", "essential" and "important" reflects the strength of the scientific evidence.

Similar alternative wordings as mentioned above are used for claims relating to different relationships between the various foods and health. It is not the intention of the regulator to adopt a detailed and rigid list of claims where all possible wordings for the different claims are approved. Therefore, it is not required that EFSA comments on each individual wording for each claim unless the wording is strictly pertinent to a specific claim. It would be appreciated though that EFSA may consider and comment generally on such elements relating to wording to ensure the compliance with the criteria laid down in the Regulation.

In doing so the explanation provided for in recital 16 of the Regulation on the notion of the average consumer should be recalled. In addition, such assessment should take into account the particular perspective and/or knowledge in the target group of the claim, if such is indicated or implied.

**TERMS OF REFERENCE**

**HEALTH CLAIMS OTHER THAN THOSE REFERRING TO THE REDUCTION OF DISEASE RISK AND TO CHILDREN'S DEVELOPMENT AND HEALTH**

EFSA should in particular consider, and provide advice on the following aspects:

- Whether adequate information is provided on the characteristics of the food pertinent to the beneficial effect.
- Whether the beneficial effect of the food on the function is substantiated by generally accepted scientific evidence by taking into account the totality of the available scientific data, and by weighing the evidence. In this context EFSA is invited to comment on the nature and quality of the totality of the evidence provided according to consistent criteria.
- The specific importance of the food for the claimed effect. For functions affected by a large number of dietary factors whether a reference to a single food is scientifically pertinent.

In addition, EFSA should consider the claimed effect on the function, and provide advice on the extent to which:

- the claimed effect of the food in the identified function is beneficial.
- a cause and effect relationship has been established between consumption of the food and the claimed effect in humans and whether the magnitude of the effect is related to the quantity consumed.
- where appropriate, the effect on the function is significant in relation to the quantity of the food proposed to be consumed and if this quantity could reasonably be consumed as part of a balanced diet.
- the specific study group(s) in which the evidence was obtained is representative of the target population for which the claim is intended.
- the wordings used to express the claimed effect reflect the scientific evidence and complies with the criteria laid down in the Regulation.

When considering these elements EFSA should also provide advice, when appropriate:

- on the appropriate application of Article 10 (2) (c) and (d) in the Regulation, which provides for additional labelling requirements addressed to persons who should avoid using the food; and/or warnings for products that are likely to present a health risk if consumed to excess.
APPENDIX B

EFSA DISCLAIMER

The present opinion does not constitute, and cannot be construed as, an authorisation to the marketing of the food/food constituent, a positive assessment of its safety, nor a decision on whether the food/food constituent is, or is not, classified as foodstuffs. It should be noted that such an assessment is not foreseen in the framework of Regulation (EC) No 1924/2006.

It should also be highlighted that the scope, the proposed wordings of the claims and the conditions of use as proposed in the Consolidated List may be subject to changes, pending the outcome of the authorisation procedure foreseen in Article 13(3) of Regulation (EC) No 1924/2006.
