<p>Section 1 Open points: 4 Points for clarification: 0 Data gaps: 1</p>	<p>Section 1 Open points: 4 Points for clarification: 0 Data gaps: 1</p>	<p>Section 1 Open points: 1 Points for clarification: 0 Data gaps: 3</p>	<p>Section 1 Open points: 1 Points for clarification: 0 Data gaps: 3</p>	
<p>Open point: 1.1 RMS to clarify whether step 1 of the manufacturing process described in the DAR is valid, as in this case the need for additional information concerning [REDACTED] as starting material is redundant. See reporting table 1(2)</p>	<p>FMC February 2009: We agree. [REDACTED] is an intermediate produced by step 1 of the manufacturing process.</p>	<p>RMS, 25 February 2009: In the original Annex C of the DAR (May 2004) it was clearly stated that, originally, the toxicology registration sample was prepared from carefully distilled [REDACTED] but some years later, the notifier was able to purchase [REDACTED]. Therefore step 1 of the manufacturing process was considered obsolete by the RMS and that is why data on the identity of [REDACTED] were required as it was considered as a starting material.</p>	<p>PRAPeR TC 06 (4 March 2009): Open point fulfilled. The meeting agreed that step one of the manufacturing process appears to be obsolete New data gap proposed, see below.</p>	
<p>New data gap 1.2 identified at PRAPeR TC 06 meeting: Notifier to provide information about the purity of the new starting material [REDACTED]</p>			<p>PRAPeR TC 06 (4 March 2009): New data gap: Notifier to provide information about the purity of one of the starting materials</p>	
<p>Open point: 1.2 The acceptability of the technical specification to be discussed in a meeting of experts.</p>	<p>FMC- February 2009: We agree with RMS: impurities [REDACTED] can be removed from the specification.</p>	<p>RMS, 25 February 2009: The revised proposed specifications of cadusafos technical as presented in table 2 of the second addendum to Annex C are considered acceptable by</p>	<p>PRAPeR TC 06 (4 March 2009): Open point fulfilled. The revised proposed specifications of cadusafos technical was discussed.</p>

Conclusions from the Reporting Table	See reporting table 1(3)	Comments from the notifier / applicant	Rappporteur Member State comments on the notifier / applicant comments	Recommendations of the PRAPeR Expert Meeting / Conclusions from the written procedure
New data gap 1.3 identified at PRAPeR TC 06 meeting: Notifier to submit further justification (e.g QC data) for specifying impurities [redacted] or they should be removed from the specification.	New data gap proposed, see below. Message sent to the tox and ecotox sections. <u>PRAPeR TC 06 (4 March 2009):</u>	the RMS. Impurity [redacted] (new code "Impurity 6") should be deleted from table 2, as it was included there due to typing error.	New data gap. Notifier to submit further justification (e.g QC data) for specifying some impurities, or to remove them from the specification.	New data gap. Notifier to submit further justification (e.g QC data) for specifying some impurities, or to remove them from the specification.
Open point: 1.3 The acceptability of presenting 5-batch data for impurities based on calculations should be discussed in a meeting of experts. See reporting table 1(10)	<u>FMC February 2009:</u> It should be noted that [redacted] analysis is technically not feasible when mixed in cadusafos technical, in the sense that such analysis suffers to many interferences. Besides, [redacted] is an [redacted] as opposed to an impurity.	<u>RMS, 25 February 2009:</u> Since the determination of the [redacted] impurities in the presence of [redacted] is not feasible, RMS accepts the notifier's approach via calculation.	<u>PRAPeR TC 06 (4 March 2009):</u> Open point fulfilled. It was noted that the formula for the conversion given in the DAR was not correct, but the calculated values are accepted. The formula was corrected in a Corrigendum to vol. 4 (March 2009)	<u>PRAPeR TC 06 (4 March 2009):</u> Open point fulfilled. It was noted that the formula for the conversion given in the DAR was not correct, but the calculated values are accepted. The formula was corrected in a Corrigendum to vol. 4 (March 2009)
Data gap: 1.1 Applicant to clarify if an overage is used in the formulation due to the fact that addition of [redacted] seems to consistently cause lower values in the a.s.	<u>FMC February 2009:</u> This is correct. [redacted] is used [redacted]	<u>RMS, 25 February 2009:</u> Clarification is acceptable by the RMS.	<u>PRAPeR TC 06 (4 March 2009):</u> Data gap closed. The original question was a misunderstanding.	<u>PRAPeR TC 06 (4 March 2009):</u> Data gap closed. The original question was a misunderstanding.

	<p>Section 2 Open points: 3 Points for clarification: 0 Data gaps: 0</p>		<p>Section 2 Open points: 1 Points for clarification: 0 Data gaps: 2</p>	
	<p>Open point: 2.1 The equivalence of the toxicological batches with the new technical specification (see Addendum 2 to Volume 4 of January 2009) has to be confirmed. See reporting table 2(9)</p>	<p>FMC February 2009: We agree with the RMS analysis described on page 9-10 of the additional report to Annex C.</p>	<p>RMS, 25 February 2009: On pages 9-10 of the additional report to Annex C the equivalence of batch E2876:8 with the new technical specification has been demonstrated. The batch E2876:8 was used in all the subchronic toxicity studies, the <i>in vitro</i> genotoxicity studies, the chronic – carcinogenicity studies and in the 2-generation reproductive toxicity study. This batch was also used in the majority of the acute toxicity studies. Therefore, from a toxicological point of view, the available data demonstrating the equivalence of E2876:8 to the new technical specification are considered sufficient. No data are available on the impurity profile of the batches used in the rest of the toxicity studies.</p>	<p>Section 2 Open points: 1 Points for clarification: 0 Data gaps: 2</p> <p>PRAPeR TC 08 (4 March 2009): Open point still open.</p> <p>The toxicological equivalence of the batches used in the mammalian toxicity studies and the proposed technical specification cannot be concluded, as well as the relevance of the impurities 8 and 17. New data gaps 2.1 and 2.2 proposed, see below.</p>
	<p>New data gap 2.1 identified at PRAPeR TC 08 meeting: The potential for genotoxicity of the impurity 8 has to be</p>		<p>PRAPeR TC 08 (4 March 2009): Data gap open. Written procedure: Data gap still open.</p>

	Section 4 Open points: 10 Points for clarification: 0 Data gaps: 0			Section 4 Open points: 0 Points for clarification: 0 Data gaps: 3
	Open point: 4.1 Member State experts to discuss if they can accept the presented QSAR estimated Koc value for methyl-2-butyl-sulfone or whether they would require a guideline batch adsorption study on three soils. Discussion to include a consideration of the potential for dissociation and therefore pH dependence of adsorption at environmentally relevant pH. See reporting table 4(2)	FMC-February 2009: There is no expectation of pH dependence on the adsorption/desorption characteristics of methyl-2-butyl sulfone. A strong base is required to dissociate the molecule. Strong bases (e.g. sodium amide or potassium hydroxide) are not anticipated to be present within environmentally relevant pH ranges for EU soils. Unlike many other pesticide sulfones, methyl-2-butyl sulfone, with only limited small chain alkyl substituents, is a weak nucleophile and will only release its slightly acidic hydrogen upon addition of a strong base. The pKa is estimated to lie within the region of pH >10.	RMS, 25 February 2009: From open literature: pKa (in DMSO) of various sulfones around 30, e.g.,  http://www.chem.wisc.edu/areas/reich/pkatable/ , therefore very weak acids	<u>PRAPeR TC 07 (4 March 2009):</u> Open point fulfilled. New data gap proposed, see below.
	New data gap 4.1 identified at PRAPeR TC 07 meeting: A guideline batch adsorption study on 3 soils is necessary			<u>PRAPeR TC 07 (4 March 2009):</u> Data gap open. <u>Written Procedure</u>

	for methyl-2-butyl-sulfone.			Data gap open The data gap is included in the updated EFSA conclusion
	<p>Open point: 4.2 Member State experts to discuss whether they can accept the standard FOCUS groundwater scenarios for Citrus or whether the soil parameterisation for the canary Islands as used in Jarvis, T (2005) should have been used.</p> <p>See reporting table 4(3)</p>	<p>FMC-February 2009: The FOCUS PEARL and PELMO citrus scenarios for Southern Europe can be considered reasonable surrogates for the Canary Islands given the assumptions of no crop interception, comparable to higher precipitation/applied irrigation patterns, similar volumetric field capacity, and wilting points. The predictions of both widely accepted EU models consisting of PEARL and PELMO indicate a safe use (values below the 0.1 g/L trigger) within standard scenarios in which the Jarvis paper identifies as an acceptable surrogate (citrus). The main difference noted in the Jarvis paper is related to the hydrologic group soil series classification where the Canary Islands soil is considered potentially more vulnerable to leaching. The comparison is performed to an only single point soil of Tenerife. It is difficult to ascertain whether this is representative or not of the Canary Islands as a whole and has not been through the rigorous reviews for representativeness that has occurred for the FOCUS scenarios.</p>	<p>RMS, 25 February 2009: The adapted scenario that was originally developed utilised the climatic and citrus growing (surrogate for banana) data from the FOCUS Seville scenario but included soil data specific to Tenerife.</p>	<p><u>PRAPeR TC 07 (4 March 2009):</u> Open point fulfilled. New data gap proposed, see below.</p>
	<p>New data gap 4.2 identified at PRAPeR TC 07 meeting: Groundwater simulations using PEARL and PELMO or PRZM and the FOCUS climate scenario definition for</p>			<p><u>PRAPeR TC 07 (4 March 2009):</u> Data gap open. <u>Written Procedure</u></p>

5. Ecotoxicology

No.	Column A Conclusions from the Reporting Table	Column B Comments from the notifier / applicant	Column C Rapporteur Member State comments on the notifier / applicant comments	Column D Recommendations of the PRAPeR Expert Meeting / Conclusions from the written procedure
	Section 5 Open points: 17 Points for clarification: 0 Data gaps: 0			Section 5 Open points: 6 Points for clarification: 0 Data gaps: 8
	Open point: 5.1 MSs to discuss and agree the refined risk assessment to birds provided in the additional report and the addendum (it seems that both documents report the same risk assessment. Could the RMS clarify?). See reporting table 5(1)	FMC-February 2009: The risk assessment to birds provided in the additional report is a refinement of the one in the Addendum of May 2005. In the additional report, more details and information are provided regarding the data source and the occurrence of birds and mammals in the banana plantation in the Canary Islands. However this risk assessment took into account conservative standard assumptions such as a depth of 0.05 m for the initial PEC calculations, knowing that during the drip irrigation, the product spreads in the first 15-20 cm around the roots of the banana plants guaranteeing its nematicide/insecticide effect. It would therefore be interesting and more accurate to refine the risk assessment in that sense.	RMS, 25 February 2009: A more pragmatic risk assessment is provided in addition following the current GD for birds and mammals (SANCO/4145/2000) taking into consideration RUD values according to Fletcher et al. (1994) and Fischer and Bowers (1997) (Appendix II, table 10) rather than using RUD of endogaeic arthropods (living in the soil) to be equal to initial PECsoil. RMS, 17 March 2009: A new risk assessment has been provided and the LoEP has been amended accordingly.	<u>PRAPeR TC 09 (5-6 March 2009):</u> Open point open. RMS to update the risk assessment for birds according to the recommendations in the expert meeting. (refer to Discussion table). <u>Written procedure</u> Open point fulfilled. LoEP was updated.
	Open point: 5.2 MSs to discuss the relevance of measured residues on	FMC-February 2009: Since cadusafos will spread to a greater depth (15-20 cm) than the standard assumption (5 cm) used in the calculation of soil	RMS, 25 February 2009: We welcome a discussion on this topic.	<u>PRAPeR TC 09 (5-6 March 2009):</u>

section 5 - Ecotoxicology

No.	<u>Column A</u> Conclusions from the Reporting Table	<u>Column B</u> Comments from the notifier / applicant	<u>Column C</u> Rapporteur Member State comments on the notifier / applicant comments	<u>Column D</u> Recommendations of the PRAPeR Expert Meeting / Conclusions from the written procedure
	<p>earthworms to refine the risk for earthworm-eating birds and mammals.</p> <p>See reporting table 5(2)</p>	<p>concentration, the laboratory derived residues are 3-4 times greater than the highest expected field residues.</p> <p>Drip irrigation close to the tree trunk confines the cadusafos to proximity of the trees. Calculation that 84% of the area of the plantation will be uncontaminated resulting in markedly lower mean earthworm residues.</p>		<p>Open point fulfilled.</p> <p>New open point proposed, see below.</p>
	<p>New open point: 5.18 RMS to recalculate the first-tier TERs for earthworm-eating birds and mammals based on the standard approach (PECsoil, Kow, Koc). It should be checked whether a reliable BCF can be derived from the earthworm reproduction study. If so, then this BCF can be used in the refined risk assessment for earthworm-eating birds and mammals.</p>		<p>RMS, 17 March 2009: A new risk assessment has been provided and the LoEP has been amended accordingly.</p>	<p><u>PRAPeR TC 09 (5-6 March 2009)</u>:</p> <p>Open point open.</p> <p><u>Written procedure</u> Open point fulfilled. LoEP was updated.</p>
	<p>Open point: 5.3 MSs to discuss the relevance of blackbird as focal species for risk assessment of cadusafos in banana plantations.</p> <p>See reporting table 5(3)</p>	<p>FMC-February 2009: According to the two main sources of information about the distribution of birds in banana plantations on the Canary Islands (Giessing, B. 2005; Birds and mammals inhabiting banana plantations on the Canary Islands - Literature survey and re-analysis of monitoring data. RIFCON GmbH Report RC 05-015, and Martín, A., Lorenzo, J.A. (2001). Aves del Archipiélago Canario. Francisco Lemus Editor. La Laguna.), blackbirds are the most abundant species in banana plantations foraging on ground dwelling invertebrates. Hence,</p>	<p>RMS, 25 February 2009: A report prepared by Rifcon proposes focal species according to recommendations provided in the SANCO/4145/2000 guidelines. It can be discussed in an expert meeting.</p>	<p><u>PRAPeR TC 09 (5-6 March 2009)</u>:</p> <p>Open point fulfilled.</p> <p>Data gap proposed, see below.</p>

	<p>mammals can be considered addressed for both spring and autumn application. Furthermore, the PD refinements should be agreed.</p> <p>See reporting table 5(6)</p>	<p>in Sept – Oct. The diet data presented in the refinement for blackbirds describes the situation in spring. Hence this scenario is covered. In autumn – due to seasonal highest food availability in general - there are even more alternative food sources available. It is highly unlikely that the blackbirds diet will consist solely (or a higher percentage) of animal feed items; rather, the majority of its diet is likely to consist of fall berries and fruits from the islands. Therefore the expected utilisation of highly exposed food items should be even lower than considered in the risk assessment, and will be therefore covered by the spring scenario data, too.</p> <p>For the Algerian Hedgehog worst case assumptions were considered in terms of diet consumption. Hence for birds and mammals actual consumption of contaminated food should even be lower than presented in the refined risk assessment.</p>		<p>Open point fulfilled.</p> <p>New data gap proposed, see below.</p>
	<p>New data gap 5.3 identified at PRAPeR TC 09 meeting: Studies to support the suggested PD values are missing. The information should also address potential differences in the seasonal composition of the diet (autumn and spring application).</p>			<p><u>PRAPeR TC 09 (5-6 March 2009):</u></p> <p>Data gap open.</p> <p><u>Written procedure</u> Data gap remains open.</p>
	<p>Open point: 5.7 MSs to discuss and agree the PT refinements used for risk assessment for birds.</p> <p>See reporting table 5(10)</p>	<p>FMC-February 2009:</p> <p>The focal species chosen represent resident rather than migratory species. Consequently, they are considered representation of fauna of the Canary Islands (as clearly stated in the references used in the Rifcon report by B. Giessing). 	<i>(Erinaceus europaeus)</i> can be used for Algerian hedgehog (<i>Atelerix algirus</i>). See reporting table 5(31)	from the Algerian hedgehog (<i>Atelerix algirus</i>) and should reflect their similar nutritional requirements.		See open point 5.6 and data gap 5.3.
	Open point: 5.15 MS to discuss the relevance of the application time of cadusafos with respect to breeding season of mammals in the canary islands. See reporting table 5(33)	There is no information that the reproductive periods of Algerian hedghogs (<i>Atelerix algirus</i>) on the Canary island differ from the population on the Spanish mainland (see e.g. http://en.wikipedia.org/wiki/Algerian_Hedgehog or Spanish Mammal Atlas).	RMS , 25 February 2009: We welcome a discussion on this topic.	<u>PRAPeR TC 09 (5-6 March 2009)</u> : Open point fulfilled. See open point 5.10.
	Open point: 5.16 MSs to discuss if the risk to ground-dwelling insects can be considered of low concern. The argumentation that only a small part of the treated area is exposed to cadusafos (due to the mode of application) could be considered acceptable. However, a more clear explanation would be appreciated (i.e. how the 16% was derived?) as well as data to support this. See reporting table 5(34)	FMC-February 2009: The cadusafos from each dripper spreads in soil to a depth of 15-20 cm. If the horizontal spread through the soil was assumed to equal 20 cm per dripper then each dripper would treat an area of 0.13m ² . With six drippers per tree the treated area per tree would be 0.78 m ² . Normal spacing between banana trees in the Canary islands is 2.0 m within rows and either 2.5 m or 3.0 m between rows. Taking 2.5 m as worst case this gives an area occupied by each tree of 5 m ² . The treated soil area per tree (0.78m ²) therefore represents 16% of the total area per tree. Expanding this to the whole plantation it can be said that 16% of the surface area of soil of a banana plantation would be treated.	RMS , 25 February 2009: We welcome a discussion on this topic.	<u>PRAPeR TC 09 (5-6 March 2009)</u> : Open point fulfilled.

	<p>MSs to discuss the reliability of the earthworm field study to address the risk to earthworm population in banana plantation.</p> <p>See reporting table 5(43)</p>	<p>The UK field study is considered a representation, but in a way conservative one, of the potential chronic adverse effects to earthworm populations exposed to Rugby 200 CS for the following reasons: (i) the field study had similar earthworm species to bananas plantations in the Canary Islands and representatives of both epilobous and tanylobous worms (ii) the application rate proposed in bananas (4000 g as ha⁻¹) is lower than the rate used in the earthworm study (4500 g as ha⁻¹), (iii) the study involves irrigation after treatment, simulating a drip scenario but across the whole plot area, (iv) bananas are a crop that is highly irrigated and fertilized, increasing the rate of cadusafos degradation and thus reducing potential exposure. Therefore the results from the UK field study (i.e., recoverable effects to earthworm abundance and biomass) translate directly as a relevant "worst-case" in banana plantations.</p>	<p>We welcome a discussion on this topic.</p>	<p><u>2009</u>):</p> <p>Open point fulfilled.</p> <p>New data gap proposed, see below.</p> <p>New open point proposed, see below.</p>
	<p>New data gap 5.7 identified at PRAPeR TC 09 meeting: Applicant to provide information on the potential of recolonisation of earthworms in the treated area in banana plantations or alternatively effects on earthworm populations in banana plantations</p>			<p><u>PRAPeR TC 09 (5-6 March 2009)</u>):</p> <p>Data gap open.</p> <p><u>Written procedure</u> Data gap remains open</p>
	<p>New open point: 5.21 RMS to update the LoEP according to the suggestions of the experts: The LoEP needs to be</p>		<p>RMS, 17 March 2009: The LoEP has been amended accordingly.</p>	<p><u>PRAPeR TC 09 (5-6 March 2009)</u>):</p> <p>Open point open. <u>Written procedure</u></p>

	updated with new application rates and PECsoil for the treated area. An explanatory footnote should be included (explaining the exposure situation – 16% of the area is treated).			Open point fulfilled. LoEP was updated.
	Message from section 1 (Phys-chem meeting): Can you accept the specification as given on page 4 of addendum 2 to Vol. 4?			<u>PRAPeR TC 09 (5-6 March 2009):</u> New data gap proposed, see below.
	New data gap 5.8 identified at PRAPeR TC 09 meeting: Applicant to provide information whether the batches used in the ecotox studies cover the specification given on page 4 of addendum 2 to Vol. 4.			<u>PRAPeR TC 09 (5-6 March 2009):</u> Data gap open. <u>Written procedure</u> Data gap remains open.
