

## **REASONED OPINION OF EFSA**

### **Modification of the existing MRLs for thiacloprid in leek and spring onions<sup>1</sup>**

**Prepared by the Pesticides Unit (PRAPeR)**

**(Question No EFSA-Q-2009-00221)**

**Issued on 26 March 2009**

#### **SUMMARY**

Germany received an application from Landwirtschaftskammer Nordrhein-Westfalen, Pflanzenschutzdienst to modify the existing MRLs for thiacloprid in leek and spring onions. Germany as the Evaluating Member State (EMS) drafted an Evaluation Report according to Article 9 of Regulation (EC) No 396/2005 which was submitted to the European Commission and forwarded to EFSA on 14 January 2009.

EFSA derives the following conclusions regarding the application, based on the Evaluation Report and the Draft Assessment Report prepared by The United Kingdom in the framework of Directive 91/414/EEC.

The metabolism of thiacloprid in primary crops is elucidated in several crop categories (fruit and fruiting vegetables, cereals and pulses and oilseeds) and a general residue definition has been derived for all commodities of plant origin as thiacloprid (parent only). Consequently, the MRL application for leek and spring onions does not require additional metabolism studies.

Submitted supervised residues field trials indicate that the current MRL of 0.02 mg/kg for leek and spring onions does not accommodate the intended GAP in Germany and a higher MRL of 0.1 mg/kg would be necessary. Adequate analytical methods are available to enforce the MRL in leek and spring onions.

The occurrence of thiacloprid or its metabolites in rotational crops was also investigated. EFSA concluded that significant residue levels in rotational crops are not expected provided that thiacloprid is applied according to the proposed GAP.

Residues in commodities of animal origin were not assessed in the framework of this application considering that leek and spring onions are not usually fed to livestock.

The consumer risk assessment was performed with the EFSA PRIMo-rev. 2, using the MRLs as established in Annex II and Annex IIIB of Regulation (EC) 396/2005 as well as the HR

and STMR values derived for the intended use on leek and spring onions. The chronic dietary intake calculations did not identify consumer intake concerns for any of European diets. The intake values ranged from 14 to 77% of the ADI. Acute risk assessment did not identify consumer intake concerns regarding leek and spring onions.

EFSA concludes that the intended use of thiacloprid on leek and spring onions is acceptable with regard to consumer safety.

### Overview of the proposed EC MRLs

Commodity	Existing EC MRL (mg/kg)	Proposed EC MRL (mg/kg)	Justification for the proposal
Leek, spring onions	0.02*	0.1	The MRL proposal is fully supported by data and no risk for consumers was identified for the intended uses.

(\*): Indicates that the MRL is set at the limit of analytical quantification.

**Key words: Thiacloprid, leek, spring onions, MRL application, Regulation (EC) No 396/2005, consumer risk assessment**

## **BACKGROUND**

Regulation (EC) No 396/2005 establishes the rules governing the setting of pesticide MRLs at Community level. Article 6 of that regulation lays down that a party requesting an authorisation for the use of a plant protection product in accordance with Directive 91/414/EEC, shall submit to a Member State, when appropriate, an application to set or modify an MRL in accordance with the provisions of Article 7 of that regulation.

Germany, hereafter referred to as the Evaluating Member State (EMS), received an application from the Landwirtschaftskammer Nordrhein-Westfalen, Pflanzenschutzdienst<sup>2</sup> to modify the existing MRL for thiacloprid in leek and spring onions. This application was notified to the European Commission and EFSA and subsequently evaluated by the EMS in accordance with Article 8 of the Regulation.

After completion, the evaluation report of the EMS was submitted to the European Commission who forwarded the application, the evaluation report and the supporting dossier to EFSA on 14 January 2009. The application was included in the EFSA Register of Questions with the reference number EFSA-Q-2009-00221 and the following subject:

*Thiacloprid - Application to modify the existing MRL for thiacloprid in leek from 0.02 mg/kg to 0.1 mg/kg and in spring onions from 0.02 mg/kg to 0.1 mg/kg*

EFSA then proceeded with the assessment of the application as required by Article 10 of the Regulation.

## **TERMS OF REFERENCE**

According to Article 10 of Regulation (EC) No 396/2005, EFSA shall, based on the evaluation report provided by the Evaluating Member State, provide a reasoned opinion on the risks to the consumer associated with the application.

According to Article 11 of that Regulation, the reasoned opinion shall be provided as soon as possible and at the latest within 3 months from the date of receipt of the application. Where EFSA requests supplementary information, the time limit laid down shall be suspended until that information has been provided.

In this particular case the calculated deadline for providing the reasoned opinion is 14 April 2009.

---

<sup>2</sup> Landwirtschaftskammer Nordrhein-Westfalen, Pflanzenschutzdienst, Siebengebirgsstrasse 200, 53229, Bonn, Germany

## THE ACTIVE SUBSTANCE AND ITS USE PATTERN

Thiacloprid is the ISO common name for (Z)-N-{3-[(6-Chloro-3-pyridinyl)methyl]-1,3-thiazolan-2-yliden}cyanamide (IUPAC).

Thiacloprid is a non-systemic insecticide. It acts as an agonist of the nicotinic acetylcholine receptors in the central nervous system. Thiacloprid is acute by stomach and contact routes. The active substance is used by foliar applications against sucking and biting insects in pome fruit, stone fruit, small berries, cotton, vegetables, sugar beet, potatoes, rice and ornamentals. Pests controlled include aphids, whitefly, beetles (e.g. *Leptinotarsa decemlineata*, *Anthonomus pomorum*, *Lissorhoptrus oryzophilus*) and Lepidoptera such as leaf miners and *Cydia pomonella*.

Thiacloprid has been peer reviewed under the Directive 91/414/EEC and is included in Annex I to this Directive by the Commission Directive 2004/99/EC for use as an insecticide only. The representative uses assessed under the peer review of Directive 91/414/EEC include the field and glasshouse uses of thiacloprid on pome fruit, fruiting vegetables, cucurbits (inedible peel) and ornamentals. Thiacloprid was not peer reviewed by EFSA.

In the European Community the MRLs for thiacloprid are established in Annexes II and IIIB of the Regulation (EC) No 396/2005 and are summarized in Appendix B. The current MRLs for spring onions and leeks are set at the LOQ of 0.02 mg/kg. Codex Alimentarius has established CXLs for thiacloprid in a wide range of commodities but there is no CXLs set for spring onions and leek.

The GAP for which an authorisation is requested in Germany refers to an outdoor use of thiacloprid on leek and Welsh onions (spring onions). For both crops the SC formulation should be applied three times at an application rate of 0.096 kg a.s./ha. The minimum waiting period for spring onions is 7 days and for leek 14 days. The details of the GAPs can be found in Appendix A.

## ASSESSMENT

### 1. Methods of analysis

#### 1.1. Methods for enforcement of residues in food of plant origin

The analytical methods for the determination of thiacloprid in foodstuffs of plant origin were evaluated in the framework of the peer review of Directive 91/414/EEC (The United Kingdom, 2000). For the determination of thiacloprid in high water content matrices and dry matrices, the HPLC-UV method with the LOQ of 0.02 mg/kg was sufficiently validated. In addition, the EMS refers to the QuEChERS multi residue method with the LOQ of 0.01 mg/kg for the commodities with high water content, high acid content and dry commodities.

It is concluded that adequate analytical methods are available for the enforcement of the proposed MRL for leek and spring onions with the LOQ of 0.02 mg/kg.

#### 1.2. Methods for enforcement of residues in food of animal origin

Commodities under consideration are not used as a livestock feedingstuff. Therefore analytical methods for determination of thiacloprid in the food of animal origin are not of relevance for the setting of the MRLs in leek and spring onions.

### 2. Mammalian toxicology

The toxicological reference values for thiacloprid were derived in the peer review under Directive 91/414/EEC and are compiled in Table 3-1 (European Commission, 2004).

Table 2-1. Overview of the toxicological reference values

	Source	Year	Value (mg/kg bw/d)	Study relied upon	Safety factor
Thiacloprid					
ADI	COM	2004	0.01	2 yr rat	100
ARfD	COM	2004	0.03	Rat, acute neurotoxicity	100

### 3. Residues

#### 3.1. Nature and magnitude of residues in plant

##### 3.1.1. Primary crops

###### 3.1.1.1. Nature of residues

Under the peer review of Directive 91/414/EEC, metabolism studies were submitted for the following crop categories (The United Kingdom, 2000):

- fruits and fruiting vegetables (apples (2 x 0.027 kg a.s./hL) and tomatoes( 2 x 0.026 kg a.s./hL))

- oilseeds and pulses (cotton seed (3 x 0.019 kg a.s./hL))

According to the RMS United Kingdom, an additional metabolism study on wheat (2 x 0.05 kg a.s./ha) was evaluated therefore covering the third crop category which was necessary to conclude on the metabolic pattern of thiacloprid in all primary plant commodities.

The metabolism in plant commodities was investigated with <sup>14</sup>C methylene labelled thiacloprid. In fruits and fruiting vegetables, the main TRR was parent thiacloprid. From the metabolism studies in apple, it was apparent that no translocation from leaves to fruits occurs. Moreover, translocation does not occur also from soil to fruit via roots, as identified in study with tomatoes. In the cotton seed parent thiacloprid was identified in small amounts (0.6 % TRR), but metabolite 6-chloronicotinic acid amounted for up to 46% of the TRR which was concluded to be the result of partitioning and selective transport effects. In wheat grain and straw at harvest the parent thiacloprid accounted for 81% and 83% of the TRR respectively. Individual metabolites did not represent more than 6%.

In general, it was concluded that metabolism of thiacloprid is similar in all plant commodities and a general residue definition for risk assessment and monitoring could be proposed as thiacloprid (parent only).

#### 3.1.1.2. Magnitude of residues

The applicant in support of the proposed GAPs submitted nine supervised residues field trials on leek and six trials on spring onions. The extrapolation from spring onions to Welsh onions is possible. The supervised residues field trials data are summarized in Table 3-1. From the supervised residues field trials data an MRL proposal of 0.1 mg/kg can be supported for both commodities.

The storage stability of thiacloprid in treated crops has been evaluated under the peer review of Directive 91/414/EEC (The United Kingdom, 2000). Studies demonstrated storage stability of thiacloprid in apple, tomato and melon peel for up to 18 months when stored below -18°C. According to the evaluation of the EMS, the supervised residues field trials data are considered valid both with regards to analytical methods and storage stability.

Table 3-1. Overview of the available residues trials data

Commodity	Region (a)	Outdoor /Indoor	Individual trial results (mg/kg)		STM (mg/kg) (b)	HR (mg/kg) (c)	MRL proposal (mg/kg)	Median CF <sup>(d)</sup>	Comments
			Enforcement	Risk assessment					
Thiacloprid									
Spring onions (Welsh onions)	NEU	Outdoor	2 x <0.01; 2 x 0.02; 0.05; 0.06	2 x <0.01; 2 x 0.02; 0.05; 0.06	0.02	0.06	0.1	1.0	R <sub>ber</sub> = 0.105 mg/kg R <sub>max</sub> =0.108 mg/kg
Leek	NEU	Outdoor	3 x <0.01; 3 x 0.01; 2 x 0.03; 0.07	3 x <0.01; 3 x 0.01; 2 x 0.03; 0.07	0.01	0.07	0.1	1.0	R <sub>ber</sub> =0.060 mg/kg R <sub>max</sub> =0.083 mg/kg

(a): NEU, SEU, EU or Import (country code). In the case of indoor uses there is no necessity to differentiate between NEU and SEU.

(b): Median value of the individual trial results according to the enforcement residue definition.

(c): Highest value of the individual trial results according to the enforcement residue definition.

(d): The median conversion factor for enforcement to risk assessment is obtained by calculating the median of the individual conversion factors for each residues trial.

(\*): Indicates that the MRL is set at the limit of analytical quantification.

### 3.1.1.3. Effect of industrial processing and/or household preparation

In the peer review a study on the effects of processing on the nature of thiacloprid was studied in the aqueous solutions of thiacloprid under three test conditions: pH 4 (90°C 20 minutes), pH 5 (100°C 60 minutes) and pH 6 (120°C 100 minutes) (The United Kingdom, 2000). It was concluded that thiacloprid is stable under representative processing conditions and no formation of toxicologically relevant metabolites occurs.

Under the current application no processing studies have been submitted and are not considered necessary since the contribution of these crops to the dietary intake is insignificant.

## 3.1.2. Rotational crops

### 3.1.2.1. Preliminary considerations

Leek and spring onions both can be grown in rotation. According to the soil degradation studies performed in the framework of the peer review, the DT<sub>90</sub> value of thiacloprid based on the field and laboratory studies is less than 100 days. More persistent in soil are thiacloprid metabolites. The DT<sub>90lab</sub> value of metabolite M02<sup>3</sup> is 262 days and the DT<sub>90f</sub> value amounts 1047 days (NEU) and 357 days (SEU). The possible accumulation of M02 in the Northern European soils is not excluded. The highest DT<sub>90lab</sub> for soil metabolites M30<sup>4</sup> and M34<sup>5</sup> is 262 and 175 days respectively.

### 3.1.2.2. Nature of residues

In the peer review the metabolism of thiacloprid in rotational crops was studied in lettuce, wheat and turnips (The United Kingdom, 2000). The <sup>14</sup>C methylene labelled thiacloprid was applied to bare soil at an application rate of 0.424 kg a.s./ha. The crops were grown in three rotations, planted 30 DAT, 170 DAT and 354 DAT. Parent thiacloprid was not identified in levels >0.01 mg/kg in any rotational crop. In general, four metabolites - M02, M30, M34 and M37<sup>6</sup> - were detected in rotational crops at levels >0.01 mg/kg. The highest amounts of them were identified in wheat straw, exceeding 0.1 mg/kg. However, during the peer review it was decided not to include these metabolites in the residue definition since they were considered of no toxicological concern. In addition, the studies on the magnitude of residues in rotational crops (see section 3.1.2.3.) demonstrate that for the intended use of thiacloprid on leeks and spring onions no significant residues (exceeding 0.01 mg/kg) will be expected in rotational crops.

### 3.1.2.3. Magnitude of residues

In lettuce, planted 30 DAT the thiacloprid metabolites M37 and M02 were 0.043 mg/kg and 0.02 mg/kg, respectively. In lettuce planted 170 DAT only M02 was still present at 0.019 mg/kg. In turnip bulbs no parent or metabolites were identified at levels >0.01 mg/kg. In turnip tops the distribution of residues was slightly different, indicating that in a crop planted

<sup>3</sup> Z)-[3-[(6-chloro-3-pyridinyl)methyl]-2-thiazolidinylidene]urea

<sup>4</sup> 2[1-(6-chloropyridine-3-ylmethyl)-3-carbamoyl-ureido]-ethane sulfonic acid sodium salt

<sup>5</sup> 2-[(aminocarbonyl)[6-chloro-3-pyridinylmethyl]amino]ethane sulfonic acid, sodium salt

<sup>6</sup> {3-[(6-chloro-3-pyridinyl)methyl]-4-hydroxy-2-thiazolidinylidene}urea

30 DAT all four metabolites were present at levels >0.01 mg/kg but not higher than 0.074 mg/kg or 42.3% TRR (metabolite M02). In turnips planted 170 DAT and 354 DAT the metabolites in leaves did not exceed 0.02 mg/kg (M37). Concerning wheat, the highest metabolite levels have been observed in wheat straw from wheat planted 30 DAT and 170 DAT respectively: M30 (0.52 and 0.8 mg/kg), M37 (0.18 and 0.41 mg/kg), M02 (0.23 and 0.47 mg/kg) and M34 (0.15 and 0.50 mg/kg). In wheat grain the highest levels of metabolites were observed in crops sown 170 DAT, but the levels did not exceed 0.04 mg/kg (M34).

Considering that application rates proposed in the framework of this application is significantly lower and that a part of the applied substance is intercepted by the treated crop, it is concluded that significant residue levels in rotational crops are not expected provided that thiacloprid is applied according to the proposed GAPs.

### 3.2. Nature and magnitude of residues in livestock

Since crops under consideration are not fed to livestock, studies on nature and magnitude of residues in livestock are not of relevance regarding the current MRL proposal.

## 4. Consumer risk assessment

The consumer risk assessment is performed with the EFSA PRIMo-rev. 2 (Pesticide Residue Intake Model), using the MRLs as established in Annex II and Annex IIIB of Regulation (EC) 396/2005 as well as the HR and STMR values derived for the intended use on leek and spring onions. Input values are summarized in Table 4-1.

Table 4-1. Input values for the consumer risk assessment

Commodity	Chronic risk assessment		Acute risk assessment	
	Input value (mg/kg)	Comment	Input value (mg/kg)	Comment
Thiacloprid				
Spring onions	0.02	STMR	0.06	HR
Leek	0.01	STMR	0.07	HR

The summary of intake calculations can be found in Appendix C.

No chronic consumer intake concerns were identified for any of European diets. The intake values were in the range of 14 – 77% of the ADI. The contribution of leek and spring onions to the total dietary intake is insignificant being 0.07% of the ADI for leeks and less than 0.01 % of the ADI for spring onions. Acute risk assessment did not identify consumer intake concerns regarding leek and spring onions.

EFSA concludes that the intended use of thiacloprid on leek and spring onions is acceptable with regard to consumer safety.

## CONCLUSIONS AND RECOMMENDATIONS

Germany received an application from Landwirtschaftskammer Nordrhein-Westfalen, Pflanzenschutzdienst to modify the existing MRLs for thiacloprid in leek and spring onions. Germany as the Evaluating Member State (EMS) drafted an Evaluation Report according to Article 9 of Regulation (EC) No 396/2005 which was submitted to the European Commission and forwarded to EFSA on 14 January 2009.

EFSA derives the following conclusions regarding the application, based on the Evaluation Report and the Draft Assessment Report prepared by The United Kingdom in the framework of Directive 91/414/EEC.

The metabolism of thiacloprid in primary crops is elucidated in several crop categories (fruit and fruiting vegetables, cereals and pulses and oilseeds) and a general residue definition has been derived for all commodities of plant origin as thiacloprid (parent only). Consequently, the MRL application for leek and spring onions does not require additional metabolism studies.

Submitted supervised residues field trials indicate that the current MRL of 0.02 mg/kg for leek and spring onions does not accommodate the intended GAP in Germany and a higher MRL of 0.1 mg/kg would be necessary. Adequate analytical methods are available to enforce the MRL in leek and spring onions.

The occurrence of thiacloprid or its metabolites in rotational crops was also investigated. EFSA concluded that significant residue levels in rotational crops are not expected provided that thiacloprid is applied according to the proposed GAP.

Residues in commodities of animal origin were not assessed in the framework of this application considering that leek and spring onions are not usually fed to livestock.

The consumer risk assessment was performed with the EFSA PRIMo-rev. 2, using the MRLs as established in Annex II and Annex IIIB of Regulation (EC) 396/2005 as well as the HR and STMR values derived for the intended use on leek and spring onions. The chronic dietary intake calculations did not identify consumer intake concerns for any of European diets. The intake values ranged from 14 to 77% of the ADI. Acute risk assessment did not identify consumer intake concerns regarding leek and spring onions.

EFSA concludes that the intended use of thiacloprid on leek and spring onions is acceptable with regard to consumer safety.

Table 5-1. Overview of the proposed EC MRLs

Commodity	Existing EC MRL (mg/kg)	Proposed EC MRL (mg/kg)	Justification for the proposal
Leek, spring onions	0.02*	0.1	The MRL proposal is fully supported by data and no risk for consumers was identified for the intended uses.

(\*): Indicates that the MRL is set at the limit of analytical quantification.

**Conclusion:**  
The estimated Theoretical Maximum Daily Intakes (TMDI), based on pTMRLs were below the ADI.  
A long-term intake of residues of Thiacloprid is unlikely to present a public health concern.

**Acute risk assessment /children - refined calculations**

**Acute risk assessment / adults / general population - refined calculations**

The acute risk assessment is based on the ARfD.

For each commodity the calculation is based on the highest reported MS consumption per kg bw and the corresponding unit weight from the MS with the critical consumption. If no data on the unit weight was available from that MS an average European unit weight was used for the IESTI calculation.

In the **IESTI 1** calculation, the variability factors were 10, 7 or 5 (according to JMPR manual 2002), for lettuce a variability factor of 5 was used.

In the **IESTI 2** calculations, the variability factors of 10 and 7 were replaced by 5. For lettuce the calculation was performed with a variability factor of 3.

**Threshold MRL** is the calculated residue level which would leads to an exposure equivalent to 100 % of the ARfD.

Unprocessed commodities	No of commodities for which ARfD/ADI is exceeded (IESTI 1):			No of commodities for which ARfD/ADI is exceeded (IESTI 2):			No of commodities for which ARfD/ADI is exceeded (IESTI 1):			No of commodities for which ARfD/ADI is exceeded (IESTI 2):					
	---			---			---			---					
	IESTI 1	*)	**)	IESTI 2	*)	**)	IESTI 1	*)	**)	IESTI 2	*)	**)			
	Highest % of ARfD/ADI	Commodities	pTMRL/ threshold MRL (mg/kg)	Highest % of ARfD/ADI	Commodities	pTMRL/ threshold MRL (mg/kg)	Highest % of ARfD/ADI	Commodities	pTMRL/ threshold MRL (mg/kg)	Highest % of ARfD/ADI	Commodities	pTMRL/ threshold MRL (mg/kg)			
	13.75	Leek	0.07 / -	9.8	Leek	0.07 / -	4.5	Leek	0.07 / -	3.4	Leek	0.07 / -

<b>No of critical MRLs (IESTI 1)</b>				---				<b>No of critical MRLs (IESTI 2)</b>				---			

Processed commodities	No of commodities for which ARfD/ADI is exceeded:			No of commodities for which ARfD/ADI is exceeded:		
	1			---		
	Highest % of ARfD/ADI	Processed commodities	pTMRL/ threshold MRL (mg/kg)	Highest % of ARfD/ADI	Processed commodities	pTMRL/ threshold MRL (mg/kg)
119.9	Raspberries juice	3 / 2.5	6.6	Apple juice	0.3 / -	
53.4	Elderberry juice	1 / -	3.2	Tomato (preserved-fresh)	0.5 / -	
51.0	Apple juice	0.3 / -	2.0	Peach preserved with	0.3 / -	
33.7	Courant juice	1 / -	1.5	Bread/pizza	0.1 / -	
29.1	Tomato juice	0.5 / -	1.1	Quince jelly	0.3 / -	

\*) The results of the IESTI calculations are reported for at least 5 commodities. If the ARfD is exceeded for more than 5 commodities, all IESTI values > 90% of ARfD are reported.

\*\*\*) pTMRL: provisional temporary MRL

\*\*\*\*) pTMRL: provisional temporary MRL for unprocessed commodity

**Conclusion:**

For Thiocloprid IESTI 1 and IESTI 2 were calculated for food commodities for which pTMRLs were submitted and for which consumption data are available.

No exceedance of the ARfD/ADI was identified for any unprocessed commodity.

For processed commodities, the ARfD/ADI was exceeded in one or several cases.

## GLOSSARY / ABBREVIATIONS

a.s.	active substance
ADI	acceptable daily intake
ARfD	acute reference dose
BBCH	Federal Biological Research Centre for Agriculture and Forestry (Germany)
bw	body weight
CAC	Codex Alimentarius Commission
CXL	codex maximum residue limit
D	day
DAR	Draft Assessment Report (prepared under Directive 91/414/eec)
DAT	days after treatment
DT <sub>90lab</sub>	period required for 90 percent dissipation (from laboratory studies)
DT <sub>90f</sub>	period required for 90 percent dissipation (from field studies)
dw	dry weight
EC	European Community
EFSA	European Food Safety Authority
EMS	Evaluating Member State
EU	European Union
FAO	Food and Agriculture Organisation of the United Nations
GAP	good agricultural practice
GC	gas chromatography
GS	growth stage
ha	hectare
hL	hectolitre
HPLC	high performance liquid chromatography
HR	highest residue
ILV	independent laboratory validation
ISO	International Organization for Standardization
IUPAC	International Union of Pure and Applied Chemistry
JMPR	Joint FAO/WHO Meeting on Pesticide Residues
L	litre
LC	liquid chromatography
LC-MS	liquid chromatography-mass spectrometry
LC-MS-MS	liquid chromatography with tandem mass spectrometry
LOAEL	lowest observed adverse effect level

LOD	limit of detection
LOQ	limit of quantification
MRL	maximum residue limit
MS	Member States
NEU	Northern European Union
NOAEL	no observed adverse effect level
PHI	pre harvest interval
PRIMo	Pesticide Residues Intake Model
RMS	Rapporteur Member State
SC	suspension concentrate
SEU	Southern European Union
STMR	supervised trials median residue
TMDI	theoretical maximum daily intake
TRR	total radioactive residue
UVD	ultra-violet detection
WHO	World Health Organisation
