

REASONED OPINION OF EFSA

Modification of the existing MRLs for indoxacarb in certain small fruits and berries¹

Prepared by the Pesticides Unit (PRAPeR)

(Question No EFSA-Q-2009-00370)

Issued on 21 April 2009

SUMMARY

Germany received an application from Landwirtschaftliches Technologiezentrum Augustenberg to modify the existing MRLs for indoxacarb in several small fruits and berries: blueberries, cranberries, rose hips, mulberries, azarole (mediterranean medlar) and elderberries. In order to accommodate for a new use of indoxacarb on these crops, the applicant proposes to raise the existing MRL of 0.02 mg/kg to 1 mg/kg. Germany as the Evaluating Member State (EMS) drafted an Evaluation Report according to Article 9 of Regulation (EC) No 396/2005 which was submitted to the European Commission and forwarded to EFSA on 30 January 2009.

EFSA derives the following conclusions regarding the application, based on the Evaluation Report, the Draft Assessment Report prepared by The Netherlands in the framework of Directive 91/414/EEC as well as MRL proposals prepared by several Member States under the former MRL legislation.

The toxicological profile of indoxacarb was investigated in the peer review and the data were sufficient to conclude on an ADI value of 0.006 mg/kg bw/d and an ARfD value of 0.125 mg/kg bw/d.

The metabolism of indoxacarb in primary crops is elucidated in several crop categories and residue definitions have been derived for all commodities of plant origin. The residue definition for risk assessment and enforcement is set as "indoxacarb (sum of R and S isomers)". Consequently, the MRL application for crops under consideration does not require additional metabolism studies. Analytical methods are available to enforce the proposed MRL in small fruits and berries.

Submitted supervised residues field trials indicate that the current MRL of 0.02 mg/kg does not accommodate the intended GAP in Germany and a higher MRL of 0.8 mg/kg would be necessary. Since small fruits and berries are perennial crops and usually not grown in rotation, no rotational crop studies are relevant for the current application. Residues in commodities of

[©] European Food Safety Authority, 2009

animal origin were not assessed in the framework of this application considering that the crops under consideration are not usually fed to livestock.

The consumer risk assessment was performed with the revision 2 of the EFSA PRIMo, using the MRLs as established in Annex II and Annex IIIB of Regulation (EC) No 396/2005 as well as the HR and STMR values derived for the intended use on blueberries, cranberries, rose hips, mulberries, azarole and elderberries. In addition, for several other crops the STMR values were available to refine the consumer intake calculations.

The chronic dietary intake calculations did not reveal any consumer intake concerns. The intake values ranged from 10 to 71% of the ADI. No acute intake risk was identified for crops under consideration.

Regarding the current MRLs for indoxacarb, they will be subject to a full risk assessment according to Article 12 (2) of Regulation (EC) No 396/2005.

Overview of the proposed EC MRL

Commodity	Existing EC MRL (mg/kg)	Proposed EC MRL (mg/kg)	Justification for the proposal						
Indoxacarb (sum of R and S iso:	Indoxacarb (sum of R and S isomers)								
Blueberries, cranberries, rose hips, mulberries, azarole, elderberries	0.02*	0.8^{a}	The MRL proposal is supported by data and no risk for consumers was identified for the proposed uses.						

(*): Indicates that the MRL is set at the limit of analytical quantification.

^a – applicant proposed 1 mg/kg, but 0.8 mg/kg is the MRL proposal derived from the MRL calculations

EFSA concludes that the proposed use of indoxacarb on blueberries, cranberries, rose hips, mulberries, azarole (mediterranean medlar) and elderberries is sufficiently supported by data and no risk for consumer health was identified.

Key words: Indoxacarb, small fruits and berries, blueberries, cranberries, rose hips, mulberries, azarole, elderberries, MRL application, Regulation (EC) No 396/2005, consumer risk assessment, indeno-oxadizine insecticide

BACKGROUND

Regulation (EC) No 396/2005 establishes the rules governing the setting of pesticide MRLs at Community level. Article 6 of that regulation lays down that a party requesting an authorisation for the use of a plant protection product in accordance with Directive 91/414/EEC, shall submit to a Member State, when appropriate, an application to set or modify an MRL in accordance with the provisions of Article 7 of that regulation.

Germany, hereafter referred to as the Evaluating Member State (EMS), received an application from Landwirtschaftliches Technologiezentrum Augustenberg² to modify the existing MRL for indoxacarb in blueberries, cranberries, rose hips, mulberries, azarole (mediterranean medlar) and elderberries. This application was notified to the European Commission and EFSA and subsequently evaluated by the EMS in accordance with Article 8 of the Regulation.

After completion, the evaluation report of the EMS was submitted to the European Commission who forwarded the application, the evaluation report and the supporting dossier to EFSA on 30 January 2009. The application was included in the EFSA Register of Questions with the reference number EFSA-Q-2009-00370 and the following subject:

Indoxacarb- Application to modify existing MRLs for indoxacarb in small fruits and berries (except currants and gooseberries) from 0.02*mg/kg to 1 mg/kg

EFSA then proceeded with the assessment of the application as required by Article 10 of the Regulation.

TERMS OF REFERENCE

According to Article 10 of Regulation (EC) No 396/2005, EFSA shall, based on the evaluation report provided by the Evaluating Member State, provide a reasoned opinion on the risks to the consumer associated with the application.

According to Article 11 of that Regulation, the reasoned opinion shall be provided as soon as possible and at the latest within 3 months from the date of receipt of the application. Where EFSA requests supplementary information, the time limit laid down shall be suspended until that information has been provided.

In this particular case the calculated deadline for providing the reasoned opinion is 30 April 2009.

² Landwirtschaftliches Technologiezentrum Augustenberg, 70197, Stuttgart, Germany

THE ACTIVE SUBSTANCE AND ITS USE PATTERN

Indoxacarb is the ISO common name for (S)-7-chloro-3- [methoxycarbonyl-(4-trifluoromethoxy-phenyl)-carbamoyl]-2,5-dihydro-indeno [1,2-e][1,3,4]oxadiazine-4a(3H)-carboxylic acid methyl ester (IUPAC). Indoxacarb as defined by ISO refers only to S enantiomer of the active substance which is a racemic mixture of S and R isomers.

The active substance in the formulated products contains the S and R isomers in the ratio 3:1 respectively.

Indoxacarb is an indeno-oxadizine insecticide. It is active as a larvicide and is taken up by stomach and contact routes. Indoxacarb, when used according to label recommendations, provides effective control of a wide range of insect pests in grapes, pome fruit, peaches, apricots, tomatoes, peppers, cucurbits, brassica vegetables, and lettuce. Major insect pests controlled includes *Lobesia botrana, Eupocilia ambiguella, Cydia pomonella, Adoxophyes orana, Eulia pulchelia, Pandermis ribeana, Pieris brassicae, Pieris rapae, Mamestra brassicae, Spodoptera exigua, Helicoverpa armigera and Plusia gamma.*

Indoxacarb has been peer reviewed under the Directive 91/414/EEC and is included in the Annex I to this Directive by the Commission Directive 2006/10/EC for the use as an insecticide only. The representative uses assessed under the peer review of Directive 91/414/EEC include field use of indoxacarb on pome fruit, grapes, brassica vegetables, stone fruit, fruiting vegetables and leafy vegetables. Indoxacarb was not peer reviewed by EFSA.

In the European Community the MRLs for indoxacarb are established in Annexes II and IIIB of the Regulation (EC) No 396/2005 and are summarized in Appendix B. For Brussels sprouts, raspberries and blackberries the MRL proposals were recently assessed by EFSA and recommendations made by EFSA were voted in the SCFAH on 30 March 2009 (EFSA, 2009a, 2009b). The current MRLs for blueberries, cranberries, rose hips, mulberries, azarole and elderberries are set at the LOQ of 0.02 mg/kg.

Codex Alimentarius has established CXLs for indoxacarb in a wide range of commodities but there are no CXLs set for small fruits and berries. The GAP for which an authorisation is requested in Germany refers to an outdoor application of indoxacarb on blueberries, cranberries, rose hips, mulberries, azarole, and elderberries once at an application rate of 0.05 kg a.s./ha. The minimum PHI is 7 days. The details of the GAP can be found in Appendix A.

ASSESSMENT

1. Methods of analysis

1.1. Methods for enforcement of residues in food of plant origin

The analytical methods for the determination of indoxacarb in the foodstuffs of plant origin were evaluated in the framework of the peer review of Directive 91/414/EEC (The Netherlands, 2005). Two analytical methods were reported in the DAR for the determination of combined S and R isomers in raw and processed plant commodities.

The DFG method S19, using GC-ECD, with the LOQ of 0.02 mg/kg was sufficiently validated for the determination of indoxacarb in fruit (apples, peaches and grapes), tomatoes, cabbage and cauliflower. The EMS Germany also refers to a modified DFG S19 method validated at 0.01 mg/kg for commodities with high acid, high water and high fat content.

The single residue method, using GC-MS, was validated for the determination of indoxacarb in small fruit, pome fruit, fruiting vegetables, brassicas and oilseeds, as well as in processed fractions from these crops. The method was validated at the LOQ of 0.02 mg/kg.

Apart from the analytical methods reported in the DAR, the EMS Germany refers to a QuEChERS method that is sufficiently validated at the LOQ of 0.01 mg/kg for the determination of indoxacarb in commodities with high acid, high water content and dry commodities.

It is concluded that adequate analytical methods are available for the enforcement of the proposed MRLs for commodities with high acid content.

1.2. Methods for enforcement of residues in food of animal origin

Crops under consideration are not used as a livestock feeding stuff. Therefore analytical methods for determination of indoxacarb residues in food of animal origin are not of relevance.

2. Mammalian toxicology

The toxicological reference values for indoxacarb have been reported in the DAR (The Netherlands, 2005) and are summarized in Table 2-1.

	Source	Year	Value (mg/kg bw/d)	Study relied upon	Safety factor
ADI	СОМ	2005	0.006	2 yr rat	100
ARfD	СОМ	2005	0.125	Rat, acute neurotoxicity	100

Table 2-1. Overview of the toxicological reference value	Table 2-1.	Та
--	------------	----

3. Residues

3.1. Nature and magnitude of residues in plant

3.1.1. Primary crops

3.1.1.1. Nature of residues

Under the peer review of Directive 91/414/EEC the metabolism studies of indoxacarb in plants were submitted for the following crop categories (The Netherlands, 2005):

- grapes, tomatoes (fruit and fruiting vegetables)
- lettuce (leafy vegetables)
- cotton (pulses and oilseeds)

These studies cover the foliar use on three crop groups. Metabolism studies indicated that S and R isomers represent the major residue component in all crops. It was concluded that plant metabolism of indoxacarb is not stereo specific. It was proposed that the ratio of both isomers used in different metabolism studies and residue trials is not of concern.

From the results of the metabolism studies on primary crops it was concluded to set a residue definition for both the risk assessment and enforcement as "indoxacarb (sum of R and S isomers)" for all commodities of plant origin.

3.1.1.2. Magnitude of residues

In support of the proposed GAP, the applicant submitted eight supervised residues field trials on blackcurrant. The number of trials is sufficient for the extrapolation from blackcurrant to the whole group of "other small fruits and berries". Residues trials data are summarized in Table 3-1. In all trials the residues of indoxacarb were in the range of 0.04-0.52 mg/kg. From the residues trials data it is concluded that a higher MRL of 0.8 mg/kg would be necessary to accommodate the intended GAP on small fruits and berries. MRL proposal does not apply to currants (black, red and white) and gooseberries for which the MRLs have already been set previously.

The storage stability of residues in treated crops has been evaluated under the peer review of Directive 91/414/EEC (The Netherlands, 2005). Studies demonstrated storage stability of racemic mixture under frozen storage conditions for at least 6 months in the fractions of processed apples and tomatoes, 10 months in wet grape pomace and lettuce, 12 months in tomatoes and 18 months in grapes and apples.

According to the evaluation of the EMS, the supervised residues field trials data are considered valid both with regards to analytical methods and storage stability.

Table 3-1. Overview of the available residues trials data

Commodity	Region	Outdoor	Individual trial	results (mg/kg)	STMR	HR	MRL	Median	Comments
	(a)	/Indoor	Enforcement	Risk assessment	(mg/kg) (b)	(mg/kg) (c)	proposal (mg/kg)	CF ^(u)	
Indoxacarb (sum o	of R and S	isomers)							
Blueberries, cranberries, rose hips, mulberries, azarole, elderberries	NEU	Outdoor	0.04; 0.05; 0.08; 0.09; 0.13; 0.21; 0.33; 0.52	0.04; 0.05; 0.08; 0.09; 0.13; 0.21; 0.33; 0.52	0.11	0.52	0.8	1.00	Trials were performed on blackcurrant but can be extrapolated to crops under consideration. (a): NEU, SEU, EU or Import (country code). In the case of indoor uses there is no necessity to differentiate between NEU and SEU.

(b): Median value of the individual trial results according to the enforcement residue definition.

(c): Highest value of the individual trial results according to the enforcement residue definition.

(d): The median conversion factor for enforcement to risk assessment is obtained by calculating the median of the individual conversion factors for each residues trial.

(*): Indicates that the MRL is set at the limit of analytical quantification.

3.1.1.3. Effect of industrial processing and/or household preparation

Under the peer review of Directive 91/414/EEC the effect of processing on the nature of indoxacarb was investigated in a hydrolysis study (The Netherlands, 2005). The nature of the residues of indoxacarb, labelled in two different ways, was studied under pasteurisation and baking/boiling conditions. The hydrolysis studies demonstrate that these conditions do not result in a formation of toxicologically significant degradation products.

The applicant has not submitted processing studies for blueberries, cranberries, rose hips, mulberries, azarole and elderberries and such are not considered necessary since the contribution of these crops to the dietary intake is very low.

3.1.2. Rotational crops

Rotational crop studies are not of relevance for the fruits and berries under consideration since they are not normally grown in rotation.

3.2. Nature and magnitude of residues in livestock

Since crops under consideration are not fed to livestock, studies on nature and magnitude of residues in livestock are not of relevance regarding the current MRL application.

4. Consumer risk assessment

The consumer risk assessment is performed with revision 2 of the EFSA PRIMo (Pesticide Residue Intake Model), using the MRLs as established in Annex II and Annex IIIB of Regulation (EC) No 396/2005 as well as the HR and STMR values derived for the intended use on blueberries, cranberries, rose hips, mulberries, azarole and elderberries. In addition, for Brussels sprouts, raspberries and blackberries the STMR values were used as obtained in the previously issued EFSA reasoned opinions on the modification of the existing MRLs for indoxacarb (EFSA, 2009a, 2009b). In addition, EFSA looked for the relevant information in evaluation reports submitted to the European Community for the MRL proposals during 2006-2008 and used the available STMR values of various commodities in the chronic consumer intake calculation. Input values are summarized in Table 4-1.

Commodity		Chronic risk assessment	Acute risk assessment		
	Input value (mg/kg)	Comment	Input value (mg/kg)	Comment	
Indoxacarb (sum of R and	S isomers)				
Blueberries, cranberries, rose hips, mulberries, azarole, elderberries	0.11	STMR	0.52	HR	
Raspberries, blackberries	0.26	STMR (EFSA, 2009b)	The acute	risk assessment	
Brussels sprouts	0.02	STMR (EFSA, 2009a)	was performed only with regard to small fruits and

Leaves and sprouts of Brassica spp.	0.22	STMR (The Netherlands, 2007e)	-	
Spinach	0.78	STMR (The Netherlands, 2007d)		
Herbs	0.38	STMR (The Netherlands, 2006b)		
Celery	0.85	STMR(The Netherlands, 2007e)		
Globe artichokes	0.04	STMR (The Netherlands, 2006a)		
Soya bean	0.03	STMR(The Netherlands, 2006a)		

The summary of the intake calculations can be found in Appendix C. The chronic dietary intake calculations did not reveal any consumer intake concerns. The contribution of small fruits and berries to the total dietary intake is insignificant. The calculated total intake values ranged from 10 to 71% of the ADI. No acute intake risk was identified for crops under consideration since the highest IESTI is 1.3% of the ARfD for blueberries.

Regarding the risk assessment of the current MRLs for indoxacarb, they will be subject to a full risk assessment according to Article 12 (2) of Regulation (EC) No 396/2005.

EFSA concludes that the intended use of indoxacarb on blueberries, cranberries, rose hips, mulberries, azarole and elderberries is acceptable with regard to consumer safety.

CONCLUSIONS AND RECOMMENDATIONS

Germany received an application from Landwirtschaftliches Technologiezentrum Augustenberg to modify the existing MRLs for indoxacarb in several small fruits and berries: blueberries, cranberries, rose hips, mulberries, azarole (mediterranean medlar) and elderberries. Germany as the Evaluating Member State (EMS) drafted an Evaluation Report according to Article 9 of Regulation (EC) No 396/2005 which was submitted to the European Commission and forwarded to EFSA on 30 January 2009.

EFSA derives the following conclusions regarding the application, based on the Evaluation Report, the Draft Assessment Report prepared by The Netherlands in the framework of Directive 91/414/EEC as well as MRL proposals prepared by several Member States under the former MRL legislation.

The toxicological profile of indoxacarb was investigated in the peer review and the data were sufficient to conclude on an ADI value of 0.006 mg/kg bw/d and an ARfD value of 0.125 mg/kg bw/d.

The metabolism of indoxacarb in primary crops is elucidated in several crop categories and residue definitions have been derived for all commodities of plant origin. The residue definition for risk assessment and enforcement is set as "indoxacarb (sum of R and S isomers)". Consequently, the MRL application for crops under consideration does not require additional metabolism studies. Analytical methods are available to enforce the proposed MRL in small fruits and berries.

Submitted supervised residues field trials indicate that the current MRL of 0.02 mg/kg does not accommodate the intended GAP in Germany and a higher MRL of 1.0 mg/kg would be necessary. Since small fruits and berries are perennial crops and usually not grown in rotation, no rotational crop studies are relevant for the current application. Residues in commodities of animal origin were not assessed in the framework of this application considering that berries and small fruits are not fed to livestock.

The consumer risk assessment was performed with the revision 2 of the EFSA PRIMo, using the MRLs as established in Annex II and Annex IIIB of Regulation (EC) No 396/2005 as well as the HR and STMR values derived for the intended use on blueberries, cranberries, rose hips, mulberries, azarole and elderberries. In addition, for several other crops the STMR values were available to refine the intake calculations. The chronic dietary intake calculation did not reveal any consumer intake concerns. The intake values ranged from 10 to 71% of the ADI. No acute intake risk was identified for crops under consideration.

EFSA concludes that the proposed use of indoxacarb on blueberries, cranberries, rose hips, mulberries, azarole (mediterranean medlar) and elderberries is sufficiently supported by data and no risk for consumer health was identified.

Commodity	Existing EC MRL (mg/kg)	Proposed EC MRL (mg/kg)	Justification for the proposal				
Indoxacarb (sum of R and S isomers)							
Blueberries, cranberries, rose hips, mulberries, azarole, elderberries	0.02*	0.8 ^a	The MRL proposal is supported by data and no risk for consumer health was identified for the proposed uses.				

Table 5-1.	Overview	of the pro	posed EC MRL
------------	-----------------	------------	--------------

(*): Indicates that the MRL is set at the limit of analytical quantification.

^a – applicant proposed 1 mg/kg, but 0.8 mg/kg is the MRL proposal derived from the MRL calculations

Regarding the current MRLs for indoxacarb, they will be subject to a full risk assessment according to Article 12 (2) of Regulation (EC) No 396/2005.

Conclusion:

The estimated Theoretical Maximum Daily Intakes (TMDI), based on pTMRLs were below the ADI. A long-term intake of residues of Indoxacarb is unlikely to present a public health concern.

Acute risk assessment /children - refined calculations

Acute risk assessment / adults / general population - refined calculations

The acute risk assessment is based on the ARfD.

For each commodity the calculation is based on the highest reported MS consumption per kg bw and the corresponding unit weight from the MS with the critical consumption. If no data on the unit weight was available from that MS an average European unit weight was used for the IESTI calculation.

In the IESTI 1 calculation, the variability factors were 10, 7 or 5 (according to JMPR manual 2002), for lettuce a variability factor of 5 was used.

In the IESTI 2 calculations, the variability factors of 10 and 7 were replaced by 5. For lettuce the calculation was performed with a variability factor of 3.

Threshold MRL is the calculated residue level which would leads to an exposure equivalent to 100 % of the ARfD.

No of commoditie exceeded (IESTI 1	o of commodities for which ARfD/ADI is cceeded (IESTI 1):			o of commodities for which No of commodities for which ARfD/ADI RfD/ADI is exceeded (IESTI 2): is exceeded (IESTI 1):			No of commodities for which ARfD/ADI is exceeded (IESTI 2):

	 *) The results of the IESTI calculations are reported for at least 5 commodities. If the ARfD is exceeded for more than 5 commodities, all IESTI values > 90% of ARfD are reported. **) pTMRL: provisional temporary MRL ***) pTMRL: provisional temporary MRL for unprocessed commodity 							
	Conclusion: For Indoxacarb IESTI 1 and IESTI 2 were calculated for food commodities for which pTMRLs were submitted and for which consumption data are available. No exceedance of the ARfD/ADI was identified for any unprocessed commodity.							

For processed commodities, no exceedance of the ARfD/ADI was identified.
